## CONTENTS

**Preface** vii

### INVITED LECTURES

Legal Deposit and Other Management Issues Crucial to National Library of India
- *Subhas C Biswas* 3

- *Bhabani Kumar Ghosh* 21

Managing Libraries in the 21st Century: Some Important Trends
- *Subal Chandra Biswas* 28

User Studies Relevance and setting Research Agenda in Changing Environment
- *Swati Bhattacharyya* 33

Marching with Mashup: Application of Information Mashup for Developing Open Library System
- *Parthasarathi Mukhopadhyay* 39

Applications of Management Information System in an Organization
- *Subarna Kr. Das* 48

### LIBRARY AS AN OPEN SYSTEM

Institutional Repository at IACS in the context of National Open Access Initiatives: A Status Report
- *Swapan Deoghuria and Swastik Sinha* 55

Open Access INIS Database: A Case Study of Nuclear Safety and Environment
- *Anil Kumar, E.R. Prakasan, Sandeep Kadam, Nita Bhaskar and K. Bhanumurthy* 62

### MANPOWER MANAGEMENT AND DEVELOPMENT

Challenges-Threats and Opportunities in Biomedical Digital Knowledge Management and Role of Library and Information Science Professionals in India: A Pilot Study
- *Surya Nath Singh* 73

Leadership Qualities for Digital Era Librarianship
- *Susmita Chakraborty* 93

TQM in Library: Survive or Banish
- *Kuldip Chand, Ramesh Lal Meena and Gurnam Singh* 97
The Role of LIS Professionals to Manage E-resources Through Electronic Resource Management System
- *Saikat Goswami and Sumana Chakraborty* 101

Challenging Roles of Information Professionals in the New Information Environment
- *Ashis Kumar Pal* 109

Development of IT Skills for Information Professionals
- *Aroja Ghosh and Munmun Bhattacharya* 115

Use of Information in Scientific Research: A Case Study
- *Mola Aditya* 122

**COLLECTION MANAGEMENT**

Acquisition of Electronic Resources: Dealing with Licensing Issues
- *R. Prabakaran and B.T. Kurahatti* 131

Usage Pattern of Information Resources at CSIR- National Metallurgical Laboratory, Jamshedpur, India
- *P.N. Mishra, N.G. Goswami and K.C. Panda* 136

Consortia Models for Networking: Some issues on CSIR consortia
- *Mitali Mohapatra and Ashok Kumar* 149

Marine Science Resources in India: a Study with Special Reference to IDR of CUSAT
- *Nitai Raychoudhury and Subir Das* 156

Management of Digital Collection
- *Ramesh Lal Meena and Sh Kuldip Chand* 165

Collection Development and Management policies: A Critical Review of Existing Policies
- *G U Dhawle, S N Dhamdhere, M A Karambelkar and N B Dahibhate* 173

Digital Library: Easy way to buildup
- *Shyamal Ghosh* 181

Need for Electronic Resource Management in Academic Libraries: a Case of The West Bengal National University of Juridical Sciences
- *Shrabani Ghosh* 188

**FINANCIAL MANAGEMENT**

Fund Raising Strategies for College Libraries in West Bengal: need of the time
- *Avijit Chakrabarti and Pritam Gurey* 199

Financial Planning and Challenges for College Libraries in Present Era
- *Atanu Das and Gayatri Paul* 206

**USERS’ MANAGEMENT**

Psychiatrists as Users: the West Bengal Scenario
- *Susmita Chakraborty and Chaitali Dutta* 217

Preface

The Indian Association for the Cultivation of Science, Kolkata Library had started its journey with the very inception of the Association in the 19th Century Bengal Renaissance. At present it is one of the best Knowledge Recourses Centre in the field of basic science in the Eastern India and served the scientific community with its multifarious resources. It is still today the only research Institute which produced a Nobel Prize (Sir C.V.Raman, 1930) in Physics for the Discovery of Raman Effect. The library has now involved in various steps of qualitative metamorphosis to cope us with the global trend. The library has faced various challenges day to day in the field of managements of online resources as well as building up effective manpower to initiate the emerging challenges. In this context IACS library is going to organize a National seminar on Challenges in Library Management System CLMS 2012, considering the seven major themes and sub themes to focus in the Seminar.

The CLMS 2012 will provide an excellent opportunity for students, faculties, information scientist and library professionals from various universities and organizations to interact with each other and exchange their expertise, practical ideas and awareness of latest developments.

We sincerely welcome and thanks to all delegates, guest speakers, participants and those who are associated with us to grand success of CLMS 2012.

Legal Deposit and Other Management Issues Crucial to National Library of India

Subhas C Biswas
Former Director, Central Secretariat Library, New Delhi
e-mail: subhas.biswas@gmail.com

Abstract: Over the last few decades the Indian legal deposit legislation or Delivery of Books Act 1954 together with limitations in application has brought stagnation in different sphere of activities of the National Library. The other two relevant acts, Press and Registration of Books Act 1867 and Copyright Act 1957 running parallel have helped in creating more confusion within both publishing and library world of India. By being under the direct control of the central government as a subordinate office of the Ministry of Culture has forced the Library to operate within the four walls of rigid rules and regulations with very little flexibility in management and policy matters. Author suggested a plan of action in a few specific sectors that could help in putting it back on growth track.

Legal Deposit Legislation:

In 1981, UNESCO published a study prepared by Jean Lunn from Canada, Guidelines for Legal Deposit Legislation. His study is now 30 years old since its publication. Many countries have amended or significantly rewritten their legal deposit laws (Germany, Indonesia, and Norway in 1990; France in 1992, Sweden in 1994, Canada in 1995, South Africa in 1997, Denmark in 1998 and Japan & Finland in 2000). Others are in the process of doing so (Australia, India, Slovenia, Spain, Switzerland and United Kingdom). The forms of intellectual and artistic expressions have grown in different dimensions. New published media have been developed and electronic publications are now an integral part of many national publishing heritages.

UNESCO was under pressure to bring out a revised edition of the Guideline in order to review the impact of it on other countries and to incorporate new forms of publishing, such as, electronic publications. The new revised and updated edition of the Guidelines of Legal Deposit Legislation (2000, UNESCO) by Jules Lariviere is found to be a useful tool. The Indian relevant act, Delivery of Books Act 1954 (rev.1956 to include newspapers and periodicals) has been under the scanner shortly after it was put into application and over the last five decades the National Library, Kolkata and the three other recipient regional public libraries, Connemara Public Library, Chennai, Central Library, Town Hall, Mumbai and Delhi Public Library, Delhi, and especially the publishing world directly involved with it, expressed concern and drew attention of the Government of India, of its limitations and ineffectiveness. The National Library, Federation of Indian Publishers (FIP) and several professional library organizations discussed its drawbacks and recommended revision or specific amendments of the act at various seminars, conferences and other forums. Ministry of Culture, the concerned agency of the government of India, set up several committees to deal with the National Library. The Recommendations of the National Knowledge Commission and its Working Group on Libraries (NKC-WGL, 2006) is completely silent on this and other national library related issues. It would be appropriate to draw attention to an article by
Bandopadhyay (2000) former Director of the National Library, is exhaustive enough with a complete set of plan of action for the concerned Ministry to initiate the revision process at the earliest. As a follow up, the Ministry took some steps to obtain the views, of other stakeholders, including academics, library users group and senior library professionals. Based on these suggestions / recommendations a revised draft bill on this issue was prepared that is awaiting final clearance of the Ministry since 2006.

**Role of Legal Deposit Act:**

In simple terms Legal Deposit is a statutory obligation which requires that any organization, commercial or public, and any individual producing any type of documentation in multiple copies, be obliged to deposit one or more copies with some recognised national institution/s. It is important to make sure that legal deposit legislation covers all kinds of published material, that is, material generally produced in multiple copies and “offered to the public regardless of the means of transmission.” Public distribution could mean “performance” or “display” e.g. radio or television programme could be considered as “published” for legal deposit purposes when it has been broadcast. Within the electronic publications environment, it should be noted that a “one copy item”; such as, a database stored on one server, could be subject to legal deposit requirement since it is made available to the public through a technology enabling the public to read, hear or view the material. (Lariviere). Most countries rely on a legal instrument of some sort in order to ensure the comprehensiveness of their national deposit collection. In all countries with legal deposit system, “published material” would naturally include books, periodicals, newspapers, microforms, sheet music, maps, brochures, pamphlets, etc. In some countries audio-visual material (sound recordings, films, videos, etc.) is also subject to legal deposit and there are several countries where electronic publications are also included into the legislation, but they have done this in different way; some have excluded on-line electronic publications because of the numerous unsolved technical problems related to their acquisition and preservation problems related to ever changing technological scenarios.

Legal deposit legislation serves a clear national public policy interest by ensuring comprehensive acquisition, recording, preservation and access of a nation’s published heritage. The role of a legal deposit system is to ensure the development of a national collection of published material in various formats. It should also support the compilation and publication of national bibliography in order to ensure bibliographic control over a comprehensive deposit collection. In addition, an effective legal deposit legislation guarantees to citizens and researchers within the country and abroad, access to research collection of the national published material. Countries are developing many different models, but are clearly unable to keep pace with the massive changes and challenges related to the deposit of intangible publications. Department of National Heritage, UK (1997) brought out a consultative paper on current legal deposit of publication issues based on a questionnaire which identified several pertinent issues and posed a number of specific questions to which sought responses from individuals and organizations. This document could also help Indian group and the government agencies in formulating the revised DB Act.

**Profile of Indian book publishing**

Before we deal with Indian Delivery of Books Act let us first look at the present trends in book publishing in India. Over the last four decades a large majority of English language publishing has concentrated in and around the capital, Delhi. The city is also a major centre of Hindi publishing industry. With the rapid growth of higher education from 1960s and the pressure built-up within the faculties due to UGC’s policy of ‘publish or perish’ resulted in the increase of publications of research monograph. India is one of the few countries where
theses and dissertations submitted for Ph.D. and other similar higher postgraduate degrees in humanities and social sciences particularly, get published as a routine matter, whereas in science and technology this would be a rare phenomenon.

There is no reliable source of annual book publishing data in India or any comprehensive list of Indian publishers in different languages. D. N. Malhotra (2010), former President of FIP and an established publisher in English and Hindi claimed of having 15,000 - 20,000 publishing houses, mostly run by individuals or as single family business. According to Vinutha Mallay Senior Editor of Mapin Publishing, India is the sixth largest publishing industry in the world with annual growth of 15-20%; third largest publishers of books in English, around 90,000 to 100,000 books are published annually, there are about 19,000 publishers in the country; in addition sixty per cent of global publishing outsourcing is based in India.

This growth trend is noticeable only from the 70s onwards when book trade turnover increased gradually due to numerical growth of educational and research institutions at every level. As we look back a few decades, the demand of English books grew fast in libraries of newly established universities, research institutions and other academic centres. Individual buyers of books constitute only a small percentage. Bulk of the titles was imported from the English speaking countries, mostly from the UK and USA based publishing houses. This book import business is largely handled by a few Delhi based book importers and distributors. To accelerate the book supply process from the shelves and warehouses the importers / distributors devised a practice of sending books on credit to academic staff and libraries, through local vendors or jobbers (newcomers in book trade to supply books 'on approval' basis). They were allowed to take back books ‘not selected’ within a credit limit of six months only.

Within a few years these jobbers turned into legitimate vendors with book stock of their own which could not be returned to the wholesalers within the stipulated six months credit limit. They start bookshops with the ‘dead stock’ of their own and continue to supply books to the institutions on prevailing terms and conditions. These vendors, having direct contacts with the researchers and faculty members on day to day basis, being the actual selectors in all educational institutions, get offers to publish research monographs of academics. Many of them grabbed these offers on their own terms thereby joining the exclusive club of publishers. We now find several of these vendors are retail bookshop owners, library suppliers and also publishers, all in one.

Perhaps it would not be out of place to add a few words of Iain Stevenson on the recent trends in British publishing keeping in mind that India is claimed to be the third largest English language publishing country. Since the beginning of this century, there have been strong trends in British publishing in the increase in concentration of publishing and book selling ownership balanced by healthy specialization and the second is an increasing awareness and impact of electronic media and delivery across sectors that have created a large impact across the book trade. In 2004 over 161,000 individual book titles were published in the U.K. as compared to 119,000 in 2001 and over 2.5 times the number in 1990. Consumers spending on books reach 2436 m. sterling pounds (in 2000 it was 2000 million) out of which 30% was from the export sales. Individual buyers comprised the largest market share, about 70% of total book sale and 20% to academic institutions and corporate bodies'.

**Indian Legal Deposit Legislation or Delivery of Books Act 1954 and its aftermath**

The act, commonly referred to as DB Act was amended in 1956 to include newspapers and serials under its purview. Annual publishing of books in India during 1950s was small
and below 30,000 titles, whereas by 2010 it is claimed to have exceeded 100,000 [estimated figure obtained from FIP in the absence of any official data from any reliable source] with substantial increase in the coverage of subjects, such as, science and technology. In a recent Annual Report of the Ministry of Culture⁴¹ the National Library claimed to have received 29,875 publications under the DB Act which happens to be only 30% of the estimated total publications as indicated by senior executives of the Library in several professional forums. It was also being pointed out in such gatherings that the other three recipient libraries under this Act, in Chennai, Delhi and Mumbai received even less during the same period. It is worth noting that this was claimed to be the highest figure ever reached by the library ‘due to a special drive’¹² ‘Intellectual resource’ (NACONAL 2006).

UNESCO Statistical Yearbook is silent on the number of books published annually or the number of libraries in India over the last several decades, although India is one of the major contributors and active member of this international body. This sad state of affairs obviously reached, and continue to be, due to simple negligence of all concern. In most other countries annual publication figures were being provided by organizations declared as recipient/s under the legal deposit or copyright legislation of the country.

There must be several reasons for the Library to reach in such a state and to argue, we guess, the limitations of DB Act cannot be the primary cause of it. Rigid administrative and fiscal rules and regulations adopted by the Library to operate under the guidance of the Ministry, is surely to my mind, a major factor but not the main one. The crux of the matter is National Library never received a large number of recent Indian publications under the DB Act. We do not know who all are claimed to be Indian publishers. A sizable number of them are ignorant of DB Act obligations. It is also a fact that number of ‘one time author-publishers’ is also very high (15% - 20%) especially in vernacular languages. The National Library together with the Central Reference Library committed to bring out Indian National Bibliography (INB) based on the books received under the DB Act, similar in format of the British National Bibliography (BNB). However, neither the British Library (formerly British Museum Library) nor the Indian National Library is in any obligation under their respective legal deposit acts to bring out national bibliographies of books thus received under their respective legal deposit acts. Bandhopadhayay¹⁳ points out, ‘rules and policy adopted are working smoothly for the British Library but similar regulations unexpectedly, failed to work in our case. One has to keep in mind the fact that default in U.K. is an exception rather than general rule unlike in India’.

The provision of penalty for default in DB Act of Rs.50.00 sounds just notional. Either revise it to a figure e.g., Rs.1000.00 or 4-5 times of the actual market price of single copy, whichever is higher or just make it voluntary, and hope for the best. The reason of suggesting the latter provision is to avoid the highly cumbersome and built-in procedural delay within our legal system. Since 1958 National Library did not take any legal action against one single defaulter till date. In UK and USA penalty clause is not mentioned as the legal deposit provision is covered under the country’s copyright acts. It is because of this factor legal deposit provision is genuinely more effective and acceptable to authors and publishers of these countries.

It would be more realistic to suggest that National Library shall receive one copy of every Indian ‘publication’ and the three other regional repository libraries in Chennai, Delhi and Mumbai shall have the right to claim any current publication in their respective regional languages only, delivered free of cost under the revised provisions of the DB Act. The current practice of demanding four copies of every publication to be delivered free of cost to each of
these four libraries (including National Library) failed to meet our expectations. This is in addition to what publishers have to comply with the demands of different state central libraries under the Press and Book Registration Act of 1867. Moreover, a large volume of these books and other publications, thus received, especially language publications that are not so commonly used in some regions are usually being ‘dumped’ or just temporarily stored as these are of ‘no use’ to the library. This is a colossal waste of national resource. On the other hand it would not be cost effective to make these so to say, ‘unused books’ (four copies of each) routinely processed, provide costly storage space as well as maintaining them for the posterity in four regional libraries. The National Library shall receive one copy for preservation and access only; create bibliographic records for the benefit of all stakeholders.

There are several categories of publications e.g. in English, Hindi, Sanskrit and Urdu (EHSU) languages shall find users in other three regional libraries. Let us accept the real time scenario in terms of availability and accessibility for application of information and communication technologies (ICT) within library systems. Bibliographic data of publications received by the National Library under legal deposit legislation will be accessible to others from INB and National Library catalogue / database online. These three libraries shall buy one copy of all selected books in EHSU languages, from any local vendor / publishers. Additional fund annually spend by three libraries on this account shall be reimbursed from a special annual central government grant. The proposed module is based on the British legal deposit act where the British Library, London receives one copy of every book / publication and the other five libraries (Wales National Library, Aberystwyth, Scottish National Library, Edinburgh, Oxford University, Cambridge University and Trinity College, Dublin) obtain direct from the publishers, one copy of every book of their choice, selected from the weekly list of books received in the British Library under the legal deposit act.

We made an attempt to get some estimation of the annual cost of books published under these four (EHSU) ‘common languages’ from INB and the National library that would give an idea of the total fund required for the three regional libraries under the revised provision of the Act. All the three libraries receive some annual grant from the central government. The revised provision in the act will also bring some savings in terms of time and resources, as lesser number of books are to be dealt with by the libraries. Sooner than later, it will be a reality (within a decade or so) of making available a digital copy of an Indian publication by the National Library online, that was not originally selected or received earlier to a library or an individual from its own stock within or outside the country. The technology is already in experimental stage at various levels. Slowly and gradually a large part of Indian publications will be brought out in e-format only, which will also change our current perception of borrowing or consulting a ‘book’ from a conventional library. Till we reach that stage in India and the transitional period of overlap (20 years?) we shall carry on with both the systems as we are now have both bullock carts as well as a BMW 7e series cars on our roads for transportation. Indian library systems shall take a longer path and time to switch over to reach this goal. Moreover, any change in our library ‘modernization’ programme shall be fully dependent on application of technological innovations resulting in inevitable acceptance of a never ending process. Thomas Abhram in a recent article expressed, “e-books will be hugely cheaper with the removal of paper and inventory costs…. All things taken into account, books in print format are not certainly going away ever from circulation. And e-books, from a publishing point of view, are a ‘consummation devoutly to be wished’. We in India, specially the National Library are to continue dealing with print copies of books for several decades together with information resources available in e-books and or in any other format.

The figures quoted above (Table-1) under Books received by the National Library under DB Act during 2007-08 and 2008-09 and those listed in INB for 2010 (CRL) were obtained from the respective libraries on personal requests. In a paper presented at the NACONAL 2006 by Mandal & Syed Abuzar\(^{(5)}\) (2006) indicated National Library received about 20,000 books annually during 1990-2002. They claimed the Library received about 30,000 during 2005-06 due to some special drive and about similar number of volumes during 2010-11 as recorded in the Annual Report of the Ministry of Culture. Unfortunately we could not get breakdown of figures under each language of 29,875 books received during 2005-06 nor of INB listed figures for 2009 and 2011. The significant gap of Oriya books received during 2007-08 and 2008-09 was due to some special efforts put by the concerned language specialist during 2007.

**Note:** Average cost of recently published books in English, Hindi, Sanskrit and Urdu (EHSU) languages has been worked out from a sample of books procured by University of Delhi, Central Library, Central Secretariat Library and the U.S. Library of Congress, Book Procurement Centre in Delhi. We made here an estimation of annual additional grant amount to be provided by central government to support the three regional libraries (in Chennai, Delhi and Mumbai) under the proposed revised legal deposit legislation. The National Library shall receive one copy only of every Indian publication free of cost delivered by the publishers, and the three regional public libraries are to purchase one copy of any book (in EHSU languages) selected by a library from open market. The three libraries are entitled, under the law, to receive free of cost, one copy of a book published in respective regional languages. It is estimated that each library shall selectively acquire per year about 30,000 new Indian publications (10,000 EHSU + 20,000 in respective regional languages) out of about 90,000 books published annually. It means, central government shall reimburse annually the cost of 30,000 books in EHSU languages where average cost of a set of four EHSU books is Rs.2000 or Rs.60 million (30,000 x2000 = 60,000,000). In addition, another 10m (Rs.10,000,000) would be required to cover annual subscription cost of EHSU periodicals and newspapers. Thus we reach an estimated figure of Rs.70m or 7croc (add another 10%
annually for inflation). These figures are being presented to get some idea of the extra cost we propose to pass on to the central government exchequer.

If this revised guidelines are adopted in our legal deposit act (now under revision) by taking over the extra burden of book fund of the three regional libraries by the central exchequer then we could surely expect of getting better cooperation from the publishing fraternity in fulfilling their responsibilities towards the provisions of the revised act. Group of publishers bringing out EHSU language publications are to supply only TWO free copies, like all other publishers, one to the National Library and the other to Parliament Library. The only sensible expectation of the publishers from the CRL / National Library is to bring out a comprehensive, up to date online INB, listing all currently published titles thus received under the act and provide facilities of easy access to the readers within a reasonable time frame.

Under the revised provision of the act, there is a strong opinion that Chennai based Connemara Public Library shall receive one copy free of cost, of every publication in Dravidian languages (e.g. Kannada, Malayalam, Tamil and Telugu). Similarly Central Library, Mumbai shall receive books in all western Indian languages, such as Marathi, Konkani, Gujarati, etc., and Delhi Public Library shall get publications in Punjabi, Kashmiri, etc. as commonly spoken in the three respective regions. National Library is to receive one copy of all the publications. In addition to the respective regional languages publications these three libraries shall purchase one copy of publications of their choice, in English, Hindi, Sanskrit and Urdu (EHSU), from publishers / local vendors. Total annual cost of this category of publications shall be reimbursed from central exchequer. With the introduction of advanced network technologies, libraries shall be benefitted for not to process (Catalogue / classify highest cost factor) these books as relevant data can be downloaded from INB. The second alternative is to incorporate legal deposit provision within the revised copyright legislation as done in the USA and UK.

It is possible to reduce the number of defaulting Indian publishers to bare minimum. Only very recently the National Library claimed to have increased intake of publications under the Act by extensive promotional work through the media and sending direct appeal to publishers that have helped it in bringing more and more publishers within the DB Act net. Secondly, if the total number of copies of each title (an average of seven copies) under both PR and DB Acts could be drastically reduced to minimum two only, there is a hope of getting full support and cooperation of Indian publishers to go by the rule book. Third and the most important factor is to make INB up to date and bring it out at regular frequency (monthly!) with the target of putting it online within a scheduled time frame. What we need is determination and political will to make the India’s National Library the effective hub of Indian library systems. Similarly, there are several other issues, listed below, which also require attention by both the National Library and appropriate government agencies that shall help in making India proud of its National Library.

Central Reference Library (CRL):

In 1971 administration of the CRL was separated from the National Library by making it a subordinate office under the Department of Culture. This was an ideal opportunity we missed, for shifting the CRL to Delhi. In the middle of 1970s Central Government created a new wing of the Central Secretariat Library (CSL) and named it as Tulsi Sadan Library to collect and provide access exclusively to all Indian language (excluding English) publications, to commemorate the 400th year of Tulsidas (of Ramcharitmanas fame). CSL could have been merged with CRL and allowed it to operate from some temporary location till a permanent ‘home’ could be found or built at the proposed site opposite to the National Museum on
Janpath, originally proposed by Edwin Lutyens. CRL would have been the natural choice of declaring it as the fourth recipient public library in Delhi, under the DBAct (instead of making the Delhi Public Library with reluctance, during the 1970s). Ministry of Culture is now under heavy pressure for shifting the Central Secretariat Library out of Shastri Bhavan complex due to severe space crunch and security issues. It is a fact that CSL has lost its original objective of serving information needs of all central secretariat units. Today all the ministries are having their own libraries with specialized collections to cater their respective information needs. It now serves as a general reading room for Shastri Bhavan employees. Reading for pleasure is not so common with the government employees. Central Secretariat Library is administratively a subordinate office of the Ministry of Culture. A large section of its regular visitors, viz. postgraduate students and research scholars have stopped visiting the library due to overwhelming security checks involved in getting through Shastri Bhavan. Recently several thousand volumes of its rich older collections were being disposed under executive orders to make room for babus of the Ministry.

It could have been easier to find a suitable location for CRL (incorporating CSL) in Delhi during 1970s. Attempts were also being made during the 1970s and 1980s to merge the CRL with the National Library but these were also stalled by staff associations of the two libraries. During this period, management of the National Library was weak as a result, library service also suffered considerably. Central government in Delhi continued to be indecisive in taking appropriate steps while local library administration in Kolkata failed to deal with the day to day issues in any effective manner. It was more of a failure of the management both at the operational as well as policy making levels. The government allowed the National Library to drift away in the absence of any suitable action plan in place to overcome the crisis. Nor there was any move or pressure from any other corner - library professionals, media or library users’ group. This long drawn uncertainty and lack of effective management control within the National Library campus directly affected services and administration of Central Reference Library thereby putting publication of INB also on the back burner.

**Indian National Bibliography (INB):**

It started in 1958 following the British National Bibliography (BNB) format. To overcome the complexity of multi-script languages it adopted Romanization of all scripts with the descriptive part of each entry in English. This has created problems for many who are not familiar with Roman script or English language. The job of printing INB monthly issues was given exclusively to the Government of India Press in Kolkata that failed to realise, from the beginning, the importance of maintaining the production and delivery schedule. After years of persuasion by CRL the Ministry allowed printing of INB through private press. Cataloguing of every title, received by the National Library under DB Act, is first to be acknowledged by the Library then sent to CRL on record, where it will be catalogued once according to INB practices and then books shall be sent back to the National Library for re-cataloguing according to its own specified rules followed by due processing for storage. This long drawn administrative procedural factors and duplication of cataloguing process have claimed to be a major cause of delay from the date of receipt of the publication to the time its record is found in INB followed by making it available to readers of National Library. This delay factor has also indirectly discouraged publishers to follow the DB Act guidelines strictly on the pretext of not finding INB to be a regular and up to date periodical either as a reliable check list of current Indian publications or a selection tool for libraries and other stakeholders; nor their publications are found in any bibliographic record of the National Library on time. National Library takes its own time, sometime nearly two years, to allow access to the books received under the DB Act. Importance of promotion and marketing of INB did never get much support from the concerned authorities. Adoption of appropriate technologies at
different levels of administration and access to resources has been continuously lagged behind.

Most national libraries of the world are having full responsibilities of preserving and allowing access to their collections by providing adequate indexing and other access tools, e.g. national bibliographies, subject bibliographies, annotated catalogues of special collections, many of these are now accessible online on their respective websites. We must allow the National Library for setting up National Bibliographic Division with full control of bringing out \textit{INB} and to provide other bibliographic services covering pan-India in appropriate standardized formats, as required from time to time. By taking full advantage of technological advances supported by a group of committed well qualified staff the Library would be able to help in both improving and widening the scope of services to individuals as well as to provide back-up services to a large number of academic and public libraries in and outside the country. For example, the day Indian libraries in general adopt the same processing format for all new titles listed in \textit{INB}, India can claim to have won half the battle in modernizing our library services and systems. Without going into details one can only highlight the fact of centralized processing initiated and applied in most national libraries which have directly and indirectly helped respective library systems of these countries. We are well aware of the fact that both the CRL and \textit{INB} are as if, linked with the DB Act by an umbilical cord that needs to be focused and dealt with separately for a drastic revision.

\textbf{Proposals}

- Title of the revised act may be “Delivery of Publications (National Library) Act.

- Definition of Publications shall include – all printed documents, such as, books, periodicals, serials, newspapers, e-publications including audio books, CD books, DVDs and digital online publications and/or any other reformatted or original document produced for commercial distribution, e.g. microform documents.

- Only one copy of all publications shall be delivered free of charge, direct to the National Library of India (or at an address specified by the Library). The act shall also make adequate provision for the three regional libraries based in Chennai, Delhi and Mumbai to receive one copy of all publications in the respective regional languages, free of cost direct from the publishers. The publishers of English, Hindi, Sanskrit and Urdu (EHSU) languages shall send one copy of each of their publications to Parliament Library.

- One copy of currently published books in four ‘common’ languages (English, Hindi, Sanskrit and Urdu) shall be selected and purchased by the three regional libraries from funds exclusively allocated by the central government.

- Any publication, irrespective of its origin, brought inside the country over one hundred copies, irrespective of its format, for commercial venture must be covered under the revised legal deposit act.

- Similarly titles published simultaneously in several countries (including India) irrespective of its origin of production / printing shall be treated as an Indian publication.

- The new revised DB Act must allow the National Library some discretionary power to discard or offer as gift to other institutions some materials received under the revised act.

- Central Reference Library (CRL) shall not have its separate identity any longer. Total CRL activities and staff shall be merged with the National Library. The backbone of
CRL is its editorial staff may be merged with different language sections of the Library. The existing separate cadres of the two libraries may continue till superannuation of each staff; all newly recruited staff shall be under single staff cadre. This merger shall not affect any of the existing staff in their emoluments or other terms of service as recommended by the Sixth Pay Commission. The proposed act of cadre merger is not unique within central government.

- **Indian National Bibliography (INB)** shall continue to be published as hard copy till such time it will be required to switch over to online electronic format. There may be some need to bring out INB in both hard and soft copies for a few more years. National Library must take a policy decision to (a) adopt a uniform cataloguing code (one of ISO approved standards that has an universal acceptability) both for INB and in-house cataloguing practices; (b) follow uniform subject headings (with modifications to suit Indian condition); (c) introduce one single guidelines for Romanization for all non-roman scripts. Effective date of these modification / modernization process shall be publicized well in advance, announcing the effective cut-off date/s of this switch over, including the time Library would require for in-house training of staff and take control of all other relevant management issues. Whether INB shall continue to record Colon Classification number of each title is a matter of argument. Ideally, (d) INB could be brought out in four parts: 1. EHSU languages, 2. Eastern Indian, 3. Southern Indian and 4. Western Indian language fascicules. However, it will meet a long standing demand, if (e) each entry in vernacular languages /scripts could also include only author and title in its original scripts. Technology for such modification is available in India.

- **Reading Room**: The new specious Bhasha Bhavan is now having the main general reading room. The old vice regal lodge, Belvedere is under major renovation. The old reading room though not designed for a library, had its exclusive charm and grandeur. It is believed, the old reading room after renovation with air conditioning facilities, shall have a permanent display of 'History of Indian Book'. It is true the National Library is one of the oldest and the largest but it cannot boast of having a comprehensive collection of early printing, various types of manuscripts and similar significant materials to support a permanent display on the topic in the old specious and attractive reading room. Perhaps, it would be more appropriate to allow the old reading room for the exclusive use of research scholars for special and private collections only. That will help in bringing back its old glory. The remaining area on the same floor (excluding the reading room) earlier occupied by administration section, entrance hall and the basement used to hold the book stacks, may be considered for all kinds of exhibition & displays, publications & sales, special bindery with conservation and preservation units. Rooms or chambers on upper floors may be allocated to language and similar specialised sections of the Library.

- The new general Reading Room in Bhasha Bhavan on the first floor is specious and well lighted. The main staircase leading to reception and display area is (a) built at an awkward location and (b) climbing the steps to reach the reading room is not comfortable for senior citizens not to talk of persons with physical disabilities. There is an urgent need of erecting an escalator from the ground level, close by the staircase especially for the benefit of these categories of library users. I am sure the authorities are seriously considering of utilizing the display area and the lobby not only for a more effective use but also to give this location a ‘most welcome and vibrant’ environmental look. There is an urgent need of adequate display of signage in all public access areas within the building. Management may have been already on the
job with the help of professional interior decorators and exhibition/display experts hired on annual contract.

- **Buildings – Underground Linkage**: The three main buildings within the Belvedere campus Bhasha Bhavan, old main building and the annexe - are all scattered over the campus area. Movement of man and material not only creates logistical hazards but also brings in unnecessary exposure to atmospheric pollution, heat and humidity. The existing practice is risky from security angle; reduces life span of documents and utterly inefficient for slowing down point to point delivery process. Now is the time for the authorities to seriously consider of linking the three main buildings through an underground tunnel while old main building is undergoing major renovation. Take for example, all the three buildings of the U.S. Library of Congress, Washington DC are inter-connected through a specious tunnel. If this subway/tunnel is constructed many of the crucial security issues and movement of men and material will be saved from fearful weather hazards. No doubt the authorities are in the process of introducing soon smart card IDs both for staff and member/visitors of the Library. In addition to seminar rooms for small group meetings the present auditorium of the National Library(annexe building) needs complete overall renovation to be fully equipped with modern technological facilities for large audio-visual presentation including concerts, lectures, conferences, etc. This is required to be an immediate need for the Library.

- **Scholars’ hostel**: The Library provides some temporary accommodation to a few outstation scholars who are new to the city and wish to stay close to the Library. This facility has been running for several years but ‘not found suitable’ by the users/scholars. The authorities have decided to build a new hostel with better facilities. This unique facility is unknown to many research scholars having experience of using several such libraries outside India. It is learnt Indira Gandhi National Centre for the Arts (IGNCA), New Delhi has started offering hostel facilities to a few selected visitors, in collaboration with a five star hotel group on full payment. Authorities are surely going overboard by extending this favour to the scholarly community. It is hoped the facilities and security issues of the new hostel will satisfy all. We are well aware of the dynamics of information and communication technologies (ICT) that has been continuously reducing gaps between source of information and the user. It is hoped the National Library will take some bold policy decisions on flexible staff structure, application of appropriate technologies to keep pace with the time and bring compatibility in services with similar national libraries of the world. There are several examples of some libraries successfully providing both information and multi-media texts online on experimental basis. We hope this Library will shortly reach a stage of providing such services to several outstation research scholars interested in Indian publications that will be more useful and better than what Google/AMAZON/Yahoo and other commercial online text delivery services offered online.

- **Publication and Research**: Over the years National Library brought out several volumes of its catalogues and two commemorative volumes narrating the historical accounts of the Library. Recently it has published a few Proceedings of conferences and seminars organized by the Library. The Library brings out a half-yearly Newsletter with limited circulation. The latest issues of the Newsletter and a pamphlet Reader’s Guide to the National Library are being brought out in a more attractive format which surely is a positive deviation from the old stereotype ‘Indian official publications’. The Newsletter may please be brought out more frequently with a wider distribution network both within and outside India, preferably online as well. The National Library
must have its own Publication Unit with a team of well qualified and trained staff with editing, designing, production and marketing background. Current practice of promoting sales and marketing of publications must not be limited to participation at national book fairs. It may be useful for the Library to hire some consulting agency to develop this Unit. There has to be one proper Sales and display area with modern display facilities to be located closer to the main foyer / entrance area.

- Publication programme of NL may include, in addition to revised and update volumes of special catalogues, facsimile editions of rare and rich examples of outstanding quality of literary works, illuminated manuscripts, calligraphy, miniature paintings, early printing in India, Indian book binding, and picture postcards etc. that will throw open a glimpse of its priceless varied resources; guide to special collections; research monographs; bringing out scholarly edited volumes of Indian manuscripts and many more. Scholarly research and similar high level academic activities needs to be encouraged and sponsored by the Library. Earlier several staff members were engaged in serious academic research and bibliographic activities that were later privately published and a few could not complete individual projects due to lack of encouragement or institutional support. It is the responsibility of the Library authorities to identify ‘quality’ staff and encourage them to pursue scholarly activities that would bring credit to the institution they serve. In addition, National Library would be having specific research projects where outside scholars and library professionals could be associated. One of its primary research areas should be library and information services and systems that would be having wider scope and coverage. Very soon the Library will bring out e-publications and create data bases both online and off line (including INB). The job of up loading its main catalogues on its web site and reformatting a section of its older collections through digitization are in progress. Materials received under DB Act (revised) must get priority for digitization, over the others, as National Library is considered to be fully responsible for the preservation and access of Indian publications for the posterity. Some of Publication Unit staff must be well qualified and trained to deal with e-publication in its entirety.

- Exhibition, Display, Promotion & Publicity: Library organizes both long and short term exhibitions and displays on varied themes, national issues and occasions or celebrations. This would require scholarly approach and specialised knowledge. As these jobs are in fact part of regular activities of the Library, a separate section with adequate trained manpower and supporting equipment and accessories would be required. Every national library is an integral part of total national heritage collection and preservation. It contributes significantly in nation building and heritage preservation. In today’s world, a national institution that serves public at large both through direct and indirect ways and means is to have an efficient media and public relation unit. Take for example the case of the Bibliothèque Nationale, Paris and its new Tolbiac building, the benefits which it provides in terms of an enlarged cultural opportunity to transmit knowledge to the general public by means of increased public programmes, exhibitions, musical and literary events and educational services. In line with the present practice adopted by several national libraries, e.g. Australia, Canada and the British Library and their success stories. Indian National Library may consider of adding a feature in its web site inviting to be enrolled as Friends and Volunteers of the National Library. One example, is to encourage young volunteers who would be visiting India / Kolkata and may be happy to provide help in processing several foreign language publications that have been accumulated and
being unattended, in return of providing just simple hostel accommodation for short duration. These groups may help in providing information or play an active role in raising fund or endowments/ bequeathing a valuable private collection or research grants on specific topics.

- National Library organizes several seminars and conferences; some are related to library and information field. It holds a few lectures every year on different topics by eminent personalities in different disciplines from India and abroad. The Library must widen its scope and be more active in this sphere, e.g. invite eminent scholars and specialists in different disciplines on payment, for annual memorial lectures, literary activities in all languages, book review club, film society, and several other cultural programmes and activities, both jointly and / or sponsored by an organization of repute. A series of events, performances and musical concerts must also be a regular feature of Library activities to enhance the size and composition of visitors. These invited lectures and other such programmes could be a part of publication series of the Library. There is no need now in Kolkata for the Library to run a children’s library as the State of West Bengal has its own public library network with children’s library programme. However, children’s literature, film, etc. must find their due place in the Library's promotional activities.

- Library staff: The image of every institution, academic or otherwise is directly related to the quality of staff and their output or activities as presented to civic society. It is one of the most crucial components of a library out of the main four: (1) Users (2) Staff (3) Information resources and (4) Building, equipment and other physical amenities. It is difficult to bring in any change for better or worse within the existing framework of rules and regulations that governs every institution under government of India, including its bureaucratic hierarchical decision making process. The other major hurdle for the Library is manpower recruitment procedures lies exclusively with the Union Public Service Commission and Staff Selection Commission (UPSC & SSC).

Government of India could seriously consider of bringing the National Library under an autonomous public trust and allow the Board of Trustees to formulate policy and planning with full responsibility for their implementation and deal directly with all management issue. The Board of Trustees shall have the power and authority to meet its total manpower requirements. The chairperson of the Board shall be an eminent scholarly personality nominated by the government. There are several prestigious institutions of national importance that are operating under similar terms and conditions. After deciding the date of implementation of this act, all staff members on the present pay role shall be given the option of continuing on their existing terms and condition until such time each of them reach superannuation stage. Those who opted to join under the new management (including all future employees) shall come under the rules and service conditions as formulated from time to time by the Trust.

Selection of manpower for the National Library through the Union Public Service Commission and Staff Selection Commission has not produced expected results. One of the main shortcomings of the present selection procedures is long delay in the selection process; another limitation for the employer (the ministry / department / National Library) of not having any say in the final selection process. Both these factors have resulted in hiring someone with ‘essential qualifications’ only. Procedural delay factor of UPSC has been depriving National Library to hire the ‘best suitable candidate’ who shall be always on demand. Another factor that affects in getting ‘new blood’ due to insignificant turnover of staff due to some rigid central government rules.
ISBN / ISSN: In early 1980s after India decided to join ISBN and ISSN programmes, both Federation of Indian Publishers and the National Library declined operational responsibilities on the plea of not having adequate man-power and facilities. The HRD Ministry, being responsible for 'book promotion', created a small unit within National Educational Resource Centre (NERC) on a temporary footing. The unit is now known by ISBN Centre. In the beginning(mid-1980s), the Centre was asking all the publishers for a copy of every new book to be delivered to the Centre for allocating ISBN. Only after carrying on with this practice for over a decade, the Centre realised the mammoth task of getting adequate staff and properly organized adequate storage space for the books thus received and worse, where to find some users. Several exhibitions of Indian publications were organised in academic institutions. But this activity was also given up shortly. Entire stock of books received earlier has all been giving to schools and colleges. Similarly the responsibility of assigning ISSN was given to INSDOC (now part of NISCAIR, CSIR). Initially INSDOC used to charge a fee for assigning ISSN to Indian periodical publications on receiving the first issue of a new title. Now NISCAIR is providing ISSN free of charge. Both these two unique identification numbers are now being allocated online to publishers. Both book trade and number of libraries find it useful for online ordering, acquisition and stock control. These numbers are also being used in creating different types of bibliographical records by libraries to provide online access to various data bases.

- It would be logical to merge these two activities related to Indian publications and for bibliographic control, under the overall control of the National Library as practiced in other national libraries or organizations, like our FIP. One may argue why disturb a system or programme that are being carried on over three decades by two different Delhi based organizations /units of the central government. We must note that both these operational units were asked to ‘carry on’ at a time when the National Library was not in a position of taking their genuine responsibilities for not having adequate experienced staff. The present temporary arrangement of having the ISBN Centre as an appendage to the HRD ministry needs to be put permanently under the National Library for effective coordination. This move could help in improving receipt figures of publications of the National Library under legal deposit legislation. Much of their operations, allocation of ISBN and ISSN are now being carried online. Today the Library has the qualified manpower and access to appropriate technologies that would allow its Units to function independently without shifting any staff one way or the other. Existing staff serving the units shall continue to be based in Delhi, only their parent ministries will change. Career of none of the staff serving in these Units will be affected by the proposed merger. On the other hand their promotional avenues would likely be widened considerably.

Press and Registration of Books Act 1876\(^{16}\) (PR Act):

This act is in a way, the first legal deposit legislation in India. It is a regulatory act enacted by the British government, with the primary intention of keeping a tab on the local printing press. It is to regulate printing presses and newspapers with the provision of receiving copies of all such items under the act. One copy of every book and other material printed in India was sent to England. Printed material in different Indian languages and subjects, thus received, were retained partly in India Office Library & Records (now merged with the British library), under the Secretary of State and the rest in the British Museum Library. The two libraries produced catalogues of printed books received under this act, in different languages. Both these libraries are now being merged together and constituted much of its South Asian
core collections of the present day British Library. Many of the books printed or published by different state governments and corporate bodies including books of general interest, were retained by the India Office Library the rest were passed on to the British Museum. British Museum in its turn, was retaining only the books considered to be of “research value” for the posterity. What happened with the books or other printed documents “rejected” by both the libraries? During my ten years (1959-69) tenure with the British Museum library, I checked for some specific books that were listed in Gazette Notifications of India but not recorded in either of these two libraries’ catalogues and hand-lists. No suitable answer was available from any corner. The two libraries in London retained only the books, etc. they considered ‘useful’, rest were gifted away.

The Act has undergone thirteen amendments between 1890 and 1960. However, major provisions remained unchanged compelling delivery of copies of each book, periodical, newspaper for the scrutiny of State government agencies' C. R. Ramasamy. To a large extent the Press and Registration of Books Act is continued to be “active” like many such acts and regulations as part of colonial hegemony. In this specific case the government of the day allowed it to be adopted as a provision of ‘safety net’ but in reality allowed one or more “free copy” of a book and other material printed in the state, to be acquired for a few libraries of choice, including one extra copy to be deposited in Parliament Library, New Delhi (this copy was earlier sent to London). This was adopted by several States to ensure access to most local publications ‘useful’ to citizenry. Surely the Parliament Library has always been in relatively better financial position to spare extra fund to acquire every suitable Indian publication from the open market. However, we suggest one copy of all EHSU language category publications shall be delivered, free of cost to Parliament Library under the revised provision of DB Act.

The present practice of receiving a copy of books, etc. published within the State, by a few selected public libraries, in return of bringing out regularly list / bibliography of current publications in state Gazette Notifications, cannot be accepted as a just and fair practice. Each state would be allocating annual grants to buy multiple copies of current publications for its public library system. To acquire one or two extra copies could not be considered an overwhelming extra burden on the State exchequer. To bring out current national bibliography of Indian publications is a job assigned to the National Library / CRL listing books received under Delivery of Books Act (1954). We suggest that INB shall be brought out regularly and promptly listing all current Indian books which shall increase its utility many fold if the author & title of every book listed is added in its original script also.

According to Paul "books are still received by the Registrar of Publications, West Bengal but the present condition of maintaining the said catalogues and their quarterly publications (in the gazette) are just chaotic and virtually non-existent. Most of the printers / publishers deposit copies of their publications once in a year. They respond only when the state government through a press insertion, invite local publishers to deposit copies of current year’s publications for preparation of the annual select list of books (intended for public library purchase also). Annual bulk purchase practice for the state public libraries is the main motivating factor to deposit copies under PR Act.” He cited several research papers on the present status of bibliographic control under PR Act, for Bengali, Marathi, Telugu, Urdu and Kannada publications in India that are not encouraging either.

We have to consider a separate line of action dealing with serials - periodicals and newspapers. There are multiple issues / editions of the same newspapers and periodicals, both in printed and electronic formats; some are in different languages published at regular frequencies or just brought out irregularly at the discrections of publishers / printers. Same
periodical or newspaper may change its title at any time; some change the frequency, place of publication, printer, publisher, editor or even stop publishing at any point of time within its life span. Majority of the newspapers and magazines, and several research journals / periodicals are also being brought out in inferior quality of paper (newsprint with high pH value) resulting in severe problems in handling and archival preservation. Many of these are currently published also in electronic format; a few academic and research journals are being brought out only in e-format. It is because of these characteristics most nations made some appropriate legal provision and identified an agency to keep track of this category of publications.

The PR Act has been amended from time to time and recently the Ministry of Information and Broadcasting, government of India informed through a press release that the Act is again in the process of further revision. However, the act in its present format may not be feasible to be applied in the case of e-books, where author / publisher has the sole right to write / rewrite / edit as and when required and distribute / allow access to it, is the sole prerogative of author / publishers. The Act continues to reflect the old philosophy for the State to act as an interventionist and that in the changed context in the country it would continue to sustain the image of anachronistic. We would suggest the new revised Act would be called only The Press Registration Act 1867 (revised) by removing the section, “Part V: Registration of Books.” The fast changing and innovative printing and publication technologies would surely justify this correctional step.

Copyright Act of India 1957 (6th revision is in progress): The UK Copyright Act of 1911 provides that the library shall, as of right, receives within one month after publication of a copy of every book published in the United Kingdom. The origins of legal deposit, however, preceded the founding of the British Museum Library (now British Library) and its continuous operation over several hundred years has contributed very largely to the library becoming the largest general collection of British publications of all period. In the United States there had been copyright legislation in 1790, 1846, 1859, 1865 and 1867 during which years the place of deposit was shifted from one agency to another, till the copyright law was finally passed in 1870 declaring that all records and other things related to copyrights and required by law to be preserved, shall be under the control of the Librarian of Congress and that includes anyone claiming a copyright on any book, map, chart, dramatic or musical composition, engraving, cut, print, or photograph” Charles A. Goodrum and Helen W. Dalrymple. There are similar legislations in several other countries that allow national libraries to receive one or more copies of all publications of that country. It would have been simpler and easier to implement if the issue of legal deposit was incorporated by amending the Copyright Act of India instead of introducing a separate act (DB Act) for the same purpose.

Currently different concerned ministries of the central government are active in revising all the three acts: Copyright act, Press and Books Registration Act and Delivery of Books Act without setting up any institutional coordination mechanism at any level. We would like to make a serious appeal to the government of India to revise the Copyright Act in conformity with many of the advanced western countries, to allow the National Library of receiving one copy of every “publication” brought out within India in every format and media for public use and distribution.

Epilogue

The paper has dealt with several issues related to major policy issues as well as administrative and professional factors that are required to be attended to by the National Library and concerned Ministry of the government of India. These ideas crept up over the
last few decades of my direct or indirect association with the Library at different points of time. What I learnt and experienced during my working with the British Museum Library (now British Library) and another similar exposure with a unit of the U.S. Library of Congress induced me to compare the relevance of their services and systems vis-à-vis those of the National Library, Kolkata. Perhaps it would be appropriate for the authorities to consider of setting up a high powered committee or commission to draw up some working module of India’s library systems and services to be fully operational in terms of its shape and size by 2020 where the National Library shall be identified as its hub (e.g. UK’s Dainton Committee, 1969).

Initially the idea was to put some of our thoughts on the proposed revision of the Delivery of Books Act 1954 as we also believe with many others, the limitations and follow up maladies in our library systems were caused partly due to several impediments of the act. The Act has been a major factor of the present stagnation in growth of the National Library but surely not the only or even the primary one. To allow the Library to be under administrative control of the central government as a subordinate office, for nearly hundred years, could be another main cause of our short sighted policy decisions. Perhaps it is too late to raise the original idea of shifting the Central Reference Library to have a permanent home in Delhi. At the same time we must find some appropriate location in Delhi to retain the collections of the Central Secretariat Library and the National Social Science Documentation Centre Library (ICSSR); already these collections have lost thousands of volumes together with a large section of their users. National Library (or CRL) may be allowed to take over these two libraries and make it part of its ‘lending library collection’. This combined collection together with its proposed ISSN & ISBN units could be moved into a suitable building (NASSDOC Library, New Delhi?). There is nothing uncommon about this proposal as one can look at the British Library’s lending section is housed in Boston Spa, Yorkshire while the main Library continue to be in the heart of London. Another weakness in Indian library world is the lack of any lobbying body or pressure group, like, professional associations, that could act as an effective watch dog. It is accepted that many, if not all these suggestions, were made at some forum or the other by different individuals or organizations and as it happened in the past these may also sink into oblivion.

Acknowledgement

Thankfully acknowledge the help provided by Prof. S Chakravorty, DG, Mr Ashim Mukherji and Mr. Syed Abuazar of National Library; Mr. K.K. Kochukoshi, Librarian, Central Reference Library and Dr. P R Goswami, Director, Central Secretariat Library in getting data on books received by the National Library under DB Act and number of entries in INB 2010 under each language.

Bhabani Kumar Ghosh
Ex Deputy Librarian
British Council Library
Kolkata

Abstract: It starts with the concept of performance measurement and its need in today's context. Steps of performance measurement discussed in detail followed by performance evaluation and performance indicators. Conclusion is that performance measurement, evaluation and indicators are not only essential but a must for any library and information centre.

0. Introduction

An outcome of the corporate planning process is a document called a “Corporate Plan”. This is a written record of an organization's objectives and how it proposes to achieve them. The corporate plan has two main components: a strategic plan and an operational plan. The acquisition, development and use of human, technical, informational and financial resources are included in the operational plan.

1. Performance measurement – what it is?

Performance measurement has been defined for librarian as the process of systematically assessing effectiveness against a predetermined norm or standard. Today there is increasing emphasis on measuring performance of library and information centre i.e. ensuring that the optimum level of service is provided so that all user needs are met.

2. Why performance measurement?

The performance is measured to:

- Determine whether and how well goals are being fulfilled
- Probe into the reasons for specific successes and failures
- Explore techniques for increasing programme effectiveness
- Establish a foundation for further research

3. Need for performance measurement

An important process of management is that of measuring the libraries or information centres programmes and measuring its performance in line of corporate goals. This has two purposes as an assessment of how the service is performing and as a satisfaction factor to the end user.
4. Steps involved in performance measurement

4.1 Set strategic objectives of the Library

Every library should have a series of strategic objectives in order to demonstrate its accountability in the organisation to which it is attached. The objectives should directly relate to the overall objectives of the parent organisation. It provides a vision of framework within which performance indicators are developed and helps to review the services the library provides.

4.2 Define services to achieve the set objectives

Before proceeding with an evaluation of library performance, it is essential to state as to what the job a library performs is and how this is done. Defining proper objectives and function of a library is essential before the start of actual performance.

4.3 Measure services by using performance indicators

Effective evaluation is served by the development and use of performance indicators. A performance indicator is a quantitative expression of the use or value of an aspect of library service.

4.4 Analysis performance with objectives

Performance evaluation is a major process in which findings are directly compared with the set objectives to see the result, how best the system is working and lacunae where the improvement is required for immediate action.

5. Systematic performance measurement

One of the most influential publications in the field of library performance measure was produced in the USA in 1990. Measuring academic library performance: a practical approach by Nancy A. Vanhanse et al. was based on work carried out for the U.S. Association of College and Research Libraries Adhoc Committee on Performance Measures and published by the American Library Association. It is described as a “practical manual” and answers four clear goals.

(1) To provide instruments which could measure the impact, efficiency and effectiveness of library operations.

(2) To enable library output to be quantified or explained in meaningful ways to administrators.

(3) To provide instruments or measures which could be used by heads of units to demonstrate performance levels and resource needs to library administrators.

(4) To enable data useful for library planning, to be gathered.

The practical manual identifies 15 measures as follows:

1. General user satisfaction  →  to identify from user survey
2. Number of items used  →  From statistics
3. Number of items used in the library but not issued  →  Measured by counting the number of books needing to be reshelved
4. Total materials used  →  The sum of 2 and 3
5. Materials availability  →  The percentage of user searches for specific materials which are successful
6. Requested materials delay → The time users have to wait for materials which they want but which are not immediately available

7. Attendance → The number of visits made to the library

8. Remote users → Any kind of use where the user does not come to the library including document delivery services

9. Total uses → The sum of 7 & 8

10. Facilities use rate → The proportion of time that a ‘facility (for example user seating, work station, photocopiers, seminar room) is in use

11. Service part-wise → The average number of users served at a stuffed service point

12. Building use → The average number of people in the library building

13. Reference transactions → Defined as an information contact that involves the knowledge, use, recommendations, interpretations or instruction of one or more information sources by a member of the library staff.

14. Reference satisfaction → Users’ evaluation of the outcome of the reference request, using a survey with five key questions concerning relevance, the amount of information, how complete the response was, the helpfulness of staff and overall satisfaction rating

15. On-line search satisfaction → Users’ own evaluation of mediated on-line search

**5.1 Output measures**

In 1987 the ALA issued a revised version of Zweizig and Rodger’s 1982 output measures for Public Libraries prepared by a team led by distinguished librarians with considerable experience in the field. There are five sets of measures, including:

- **Library Use Measures**: such as library visits per capita of the population served by the library and the percentage of that population registered as library users.

- **Material Use Measures**: average number of items circulated per capita of the population served, in library materials use or average number of circulation per volume owned.

- **Material Access Measures**: which are concerned with determining how successful users are in finding the materials they want.

- **Reference Service**: incorporating a measure of the number of reference transactions per-capita of the population, defined as the proportion of reference transactions successfully completed.
5.2 Keys to Success Manual for PM

The keys to success manual for public libraries emerged from a British Library funded study which sought to provide a standardized approach to performance measurement for British Libraries.

Key to success recommended 21 performance measures. They are as follows:

1. **Service input cost measures**
   - PM 1 Amount of resources applied to each service
   - PM 2 Amount of funding applied to each service
   - PM 3 Attributes of the service which affect the cost and/or the quantity and/or quality of outputs

2. **Service output measures**
   - PM 4 Quantities of outputs for each service
   - PM 5 Quality of output
   - PM 6 Timeliness of output
   - PM 7 Availability of service measured by the number of hours the service is available
   - PM 8 Accessibility of the service which may involve measuring the physical distances

3. **Service effectiveness measures**
   - PM 9 Amount of use
   - PM 10 Users’ perception of attributes
   - PM 11 Users’ expressed satisfaction
   - PM 12 User indicated importance
   - PM 13 Purpose of use
   - PM 14 Consequence of use

4. **Service domain measures**
   - PM 15 Total population size
   - PM 16 Total population attributes
   - PM 17 User population size
   - PM 18 User population attributes
   - PM 19 Size of geographic area
   - PM 20 Geographic area attributes
   - PM 21 Information Need

6. Performance Evaluation what it is?

   The performance evaluation of library and information service is an essential management activity. In a rapidly changing environment it is necessary to look closely at both system and services in order to determine levels of use and the degree to which
services are meeting users' needs. In a user-oriented environment it is necessary to use predefined measures in a systematic way to analyse the impact and quality of a service, as perceived by its users, and to be able to translate the results into action options which will ensure that services are meeting users' consistently.

Performance evaluation is important to the success of the organisation. Performance evaluations are undertaken for several reasons; one reason is to provide the employee with the feedback. This type of evaluation should consist of the elements (1) daily informal oral comments and (2) periodic written comments given by the immediate supervisors. Another reason is to discuss problems arising from the work situation.

Performance evaluation when carried out correctly, meets several important needs. In performance evaluation, the totality of an information service should be examined in order to get a feel of the overall performance and an idea of how the various components interact. The components of the system or service are examined in isolation.

6.1 Measures for performance evaluation

Two sorts of measures can be used for performance evaluation.

*Input* – measures investigate the system from the viewpoint of its operators and look at the resources invested, and how they are deployed: money spent, in total and in detail; number of staff, in total and in particular functions; number of purchases, enquiries, loans, etc.

*Output* – measures try to look at user satisfaction and the extent to which the service is succeeding in its objectives.

Performance evaluation has been applied to components of systems and services in libraries and information centres. Other areas which are subjects of such investigations are reference services, library collections, document delivery, current awareness etc.

7. Performance Indicators: what it is?

Indicators are prescriptions of measurement. Indicators are needed to

(a) Analyse the present situation
(b) Make comparisons
(c) Measure change over time

For monitoring and evaluation of programmes four types of indicators are available and used

\[ \text{Input} \rightarrow \text{Process} \rightarrow \text{Output} \rightarrow \text{Outcome (or impact)} \]

*Input Indicators* refer to material and human resource which means infrastructure, equipment and staff. They are important to measure accessibility and availability of services.

*Process Indicators* refer to activities that take place e.g. training of staff, organizing outreach etc. but also to use and utilization of the services.

*Output Indicators* refer to the output of these activities e.g. number of users visited. These indicators are important to measure coverage, efficiency and efficacy.

*Outcome or Impact Indicators* refer to the impact on user's attitude. Effectiveness is one of the indicators those measures the impact on attitude action in a given population.

Although it is desirable to use quantitative indicators, it has to be taken into account that they describe only selected aspects of reality in terms of figures. In some cases the
qualitative description of the phenomena observed reflects reality much better than quantitative indicator i.e. the communication between staff and a community.

Performance indicators must be relevant to the cause and should clearly relate to the specific objectives of the programme. Above all, they should be measurable. The information used must be reliable and valid. Data collection should be accurate, unbiased and collected in time for proper use to be made of it. It is most important that the indicators can be translated into meaningful information for use by all who require them.

### 7.1 Keys to Success Manual for PI

1. **Operational performance indicators**
   - PI 1: Productivity
   - PI 2: Cost per output (cost per enquiry)
   - PI 3: Cost by attribute level
   - PI 4: Productivity by attribute level

2. **Effectiveness indicators**
   - PI 5: Turnover rate (relationship between the amount provided and the amount used)
   - PI 6: Amount of use by attribute level
   - PI 7: User satisfaction
   - PI 8: User satisfaction by attribute level
   - PI 9: Amount of use by satisfaction level

3. **Cost effectiveness indicators**
   - PI 10: Cost per use
   - PI 11: Cost per user
   - PI 12: Cost per capita
   - PI 13: Cost by satisfaction level

4. **Impact indicators**
   - PI 14: Users as a proportion of the population both overall and for individual services
   - PI 15: User per capita
   - PI 16: Needs fill rate, being the proportion of needs identified that one actually met

### 7.2 Performance indicators and strategic management

Performance indicators are measures of performance which can be designed as management tools to help identify areas for service improvement. Their design and the information they provide also has a strategic dimension. Service managers' interest in performance indicators may be for use in decision making, to derive quantitative measures by which to assess the levels and quality of service and to use for feedback into the planning process.

Performance measures should be both the product of the definition of strategic objectives and the output measures that feed back into the planning process.
Reference evaluation is a major ingredient for successful management, but it has to take place within an overall process that has clearly defined objectives which are specific to users' needs.

Performance measurement has a valuable role to play in the construction of SWOT (stands for Strengths, Weaknesses, Opportunities and Threats) analysis. Where such measures are in line with the objectives and targets of a service, that data will feed directly into the process of ascertaining the strengths and weaknesses of a service in particular but potentially opportunities and threats too.

6. Conclusion

Library performance measurements have become much more sophisticated in recent years and the subject plays an important part in the management process in all types of library and information service.

Performance measurement, performance evaluation and performance indicators are important because they provide the controls by assessing how the library or information centre is performing and can be used as accountability to the end users of the library.

Introduction

The library is one of the oldest types of institutions in our society. It is in the midst of rapid change in recent times. The changes mirror those going on in other institutions and also in the society as a whole. Human civilisation has so far experienced three waves of social change, viz. the age of agriculture, the age of industrialisation and the age of information. Most modern libraries are 'hybrid' libraries characterised by print and electronic collections, manual and ICT (information and communication technology) based services. Hence, they must move beyond their traditional role as custodians of books and integrate new methods of storage and transmission of information into an already existing structure. Modern libraries must link the users with the information they seek. Today's users expect more from libraries than ever before.

Objectives

The present paper intends to focus on the following noteworthy aspects of library management as experienced by the library managers world-wide:

- Strategic planning
- Organisational structures
- Staffing
- Budgets
- Change management

Strategic Planning

The importance of planning in managing any organisation, be it a library or a hospital or a corporation, cannot be underemphasised. Planning bridges the gap between where we are now and where we want to be. Futuristic aspects of planning are troublesome. Since we live in a turbulent environment, it is hard to make long-term plans. Strategic thinking provides a plan of action for resource allocation. It also affects performance and financial success. Strategic thinking is an outgrowth of the open systems approach to organisations. It is now felt that you cannot successfully manage an organisation without paying attention to the environment.

The strategic management process involves the following set of interlinked activities:

1. Setting the mission, objectives, and strategies
2. Analysing the environment
3. Identification of opportunities and threats
4. Analysing the resources
5. Identification of strengths and weaknesses
6. Reassessment of the mission and objectives
7. Formulation of strategies
8. Implementation of strategies
9. Evaluation of results

Out of the above, the step 2, i.e., ‘analysing the environment’ incorporates two sub-components, viz., scanning the environment and gathering competitive intelligence. SWOT analysis helps in finding the strengths, weaknesses, opportunities, and threats faced by the library. Identification of the opportunities originates from the overlap between the library’s resources and its environment. Libraries, despite being non-profit organisations, have competitors too, particularly when some people have began to believe that the Internet is the library. So libraries are becoming more user-oriented. They are ‘borrowing’ ideas from other organisations such as bookstores like, Borders in the United States or W.H. Smith in the United Kingdom. Also, many libraries are increasingly looking for value added opportunities and are compelled to finding ways to market their services. More and more libraries are trying to improve services by complying with measures such as benchmarking, LibQUAL+®, DigiQUAL®, MINES for Libraries®, Lib-Value, etc.

A number of tools are available for putting the strategies into action, which can be grouped under the following heads:

a) Leadership
   - Persuasion
   - Motivation
   - Culture/values

b) Human resources (based on performance of staff)
   - Recruitment/selection
   - Transfers/promotions/training
   - Layoffs/recalls

c) Information and control systems Pay, reward system
   - Budget allocations
   - Information systems
   - Rules/procedures

d) Structural design (helps to determine the strategies)
   - Organisation chart
   - Teams
   - Centralisation/decentralisation
   - Facilities, task design

Once the strategies are formulated, these need to be implemented into reality. Finally, how far the library has successfully implemented these strategies into action is to be evaluated
using various performance measures. One important point should be kept in mind relating to planning. We all know the future is always uncertain. The librarian must have contingent plans to deal with the unforeseen.

**Organisational Structure**

Organising is the establishment of the formal structure of authority, through which work subdivisions are arranged, defined and coordinated for achieving the defined objective of the organisation. Following are some of the key trends in organisational structure observed in libraries during the first decade of the 21st century:

- Most libraries are still hierarchies but with more communication between sections
- Establishment of new departments to fill new responsibilities Some libraries are using teams of workers
- New structures are developed to reflect user orientation

The emerging new forms of organisational structure in libraries can be compared with the erstwhile forms as follows:

<table>
<thead>
<tr>
<th>Old Forms have</th>
<th>New Forms have</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rigid hierarchy</td>
<td>Collaboration</td>
</tr>
<tr>
<td>Fixed duties</td>
<td>Adaptable duties</td>
</tr>
<tr>
<td>Many rules</td>
<td>Fewer rules</td>
</tr>
<tr>
<td>Formal communication</td>
<td>Informal communication</td>
</tr>
<tr>
<td>Centralised decisions</td>
<td>Decentralised decisions</td>
</tr>
<tr>
<td>Taller structures</td>
<td>Flatter structures</td>
</tr>
</tbody>
</table>

One most popular new approach to organisation is the ‘team approach’. Teamwork is action performed by a team towards a common goal. A team consists of more than one person, each of whom typically has different responsibilities. Team organisation is blessed with the following advantages:

- Reduced barriers among departments
- Quicker response time
- Better morale
- Reduced administrative overhead

However, despite the above advantages, the team approach has a number of disadvantages as well. Some of these are:

- It demands dual loyalties, which may give rise to conflicts
- More time and resources are likely to be spent on meetings
- Gives fewer opportunities for traditional career advancement

**Staffing Issues**

Staffing is the whole personnel function of bringing in and training the staff and maintaining favourable conditions of work, both qualitative and quantitative. Libraries in the 21st century are more automated than ever before but still are labour intensive
organisations. The staff is the library’s most important resource. We must find out what characteristics do new hybrid librarians need. The new 'hybrid' librarians need to:

- Have traditional library skills including a commitment to service
- Be technologically savvy
- Be flexible and able to cope with changes
- Be able to work cooperatively
- Be life long learners

Of late, under-mentioned new trends in staffing of libraries have emerged:

- Jobs and work patterns have become more flexible
- Library managers have to cope with a diverse workforce
- There is an increasing need for staff development

Library managers could utilise a number of new ways to structure various staff positions available in their libraries like,

- Job sharing
- Flexible hours
- Job rotation
- Telecommuting
- Outsourcing

The spread of globalisation has brought a number of challenges before the managers of any organisation. The challenge of managing a diverse workforce is one of these. Librarians need new skills in managing workers from different cultural, linguistic, and may be national backgrounds.

There is also a need for staff development pertaining to:

- Recruitment and retention (and salaries to match skills)
- All librarians need to be life-long learners
- Additional training facilities are required
- Career ladders and means for progression within an organisation to be chalked out

**Budgets and Finance**

Budgets are almost always too small compared to the requirement. We all seek ways to provide better services more economically. Because most libraries are publicly funded, we are accountable to the taxpayers too.

Libraries are coping with budget shortfalls by:

- Entering into cooperative partnerships to cut costs
- Looking for innovative ways to provide access to periodical literature
- Giving up some services to implement others
- Looking for champions and allies in the budgeting process and in fund raising

Annual statistics compiled by the Association of Research Libraries (www.arl.org) reveal that cost of all types of library material continues to rise steeply over the last three decades.
In order to get round of this problem, especially the exorbitant increase in the prices of periodical literature as well as research databases, libraries are entering into cooperative agreements (e.g., Delnet (Developing Library Network), TRLN (Triangle Research Libraries Network), etc) and consortia (e.g., INDEST (Indian National Digital Library of Engineering Sciences & Technology), UGC-Infonet, etc).

New approaches to scholarly publications such as JSTOR (Journal Storage), SPARC (Scholarly Publishing and Academic Resources Coalition), PLoS (Public Library of Science), etc have been developed through joint venture of various agencies as remedy towards solving what is now epitomised as the 'crisis' in scholarly communication.

It is sometimes necessary to cut services to remain effective. The librarian has to ask himself/herself, “What am I doing that don't have to be done?” S/he has to cultivate champions for libraries by entering into the politics of management, creating strategic alliances, and cultivating sponsors and donors for the library.

Librarians as Change Managers

Nothing can better emphasise the need for change. Every organisation needs to change with time; failing which, it stands the risk of being pushed into oblivion and being labeled as obsolete by the more enterprising competitors in the market. The cycle of change is never-ending. So librarians need to accustom themselves to it. Librarians need to handle change effectively to survive and thrive in today's environment. The future for libraries can be an exciting and challenging one for those libraries that are both able and open to change.

Conclusion

There are a number of challenges facing the manager of a library in the 21st century. Strategic planning must take the rapidly-changing environment into account. Organisational challenges will involve restructuring the traditional library allowing the staff to work in a flexible team-based organisation. Managers of 'hybrid' libraries need to have new skills. In this age of globalisation they have to manage a diverse workforce. Librarians have to look for innovative approaches like participation in consortia and open access ventures for solving the problems of rising prices of library materials. They have to learn the politics of management and find champions for the library's cause. The future of libraries could be made secure only if the librarians adapt themselves to the forces of change.

Bibliography

Introduction

Since computer and communication technologies have made inroad into libraries, each era brought new challenges for libraries. The most challenging question has been whether there is any need of libraries in this all-pervasive era of Web. This question has made libraries to look into how libraries and new technologies can be enmeshed in order to provide services that are meaningful to contemporary users. As a result, libraries got automated, enhanced collection by adopting electronic publications, extended activities by developing portal/websites in order to disseminate information which is otherwise not possible through automated catalog. But are technologies and resources suffice to serve user community? Interactions with users reveal that most users avoid library catalog, that many users start their search for information with Google Scholar and not with library-provided bibliographic databases. So where is the limitation of technologies adopted or resources gathered by libraries?

Hence when technologies were changing the face of libraries, user study also started gaining importance. Librarians realized that one-size-fits-all paradigm is not tenable for library services and its users, and started asking “if we build it, will they come”? Consequently, with emergence of new systems, researchers tried to understand what do users want to use, why do they want to use, how do they search and how do they put the result into use. The purpose was to develop better interface, efficient data organization. Initial attempts to external views of users requirements gave way to a new approach looking at the whole process through users’ eyes and then attempting to develop a system which would be akin to users’ thought process. Thus users became the center for such research. A wide range of theories covering affective, cognitive and social aspects of users have been used in last three decades in this research stream.

It is now recognized that resources, technologies and users are three pillars of libraries and all three pillars are evolving in nature. Across libraries, there have been various types of resources and with the passage of time, resources have undergone changes in format and presentation; also various technologies have contributed to effective storage and retrieval of information about resources or from resources. While resources and technologies can be acquired and are passive pillars, it is the users of a library which are active pillars and dynamic entities. Resources are procured for users, technologies are used to shape the services for users using those resources. With the evolution of libraries in terms of resources and technologies, users have occupied an important position in empirical research in LIS in order to understand how resources are being used by users or how technologies are contributing to proper and effective use of those resources.
The reason why understanding users is important is that users are human beings with psychological and social characteristics. They can make a choice of how the resources and technologies can be used. At the same time, they can also be influenced by resources and technologies as well as by other users. Hence libraries always face challenges not only in terms of resources and technologies but also in terms of users. Unless it is understood how users are using various resources, how technology is shaping them or they are shaping the use of technologies, no meaningful service can be offered. This realization has generated interests among researchers to conduct user studies over past sixty years.

User studies have been variously known as studies on “information need,” “information behavior,” “information need, seeking and use.” These areas cover a wide range of studies of users. Broadly these studies can be grouped under two categories. One, the studies which attempted to understand the nature of information need and how such needs are met with the help of various information resources. The other studies focused on how users interact with system/technologies in order to find information. While the former studies aim at developing resource base, the latter studies focus on how to develop a system that synchronizes with the information searching process of individuals. Libraries being conduit between individuals and their potential information resources, practicing professionals in the field have taken a great interest to develop an efficient system which can deliver relevant and pertinent information to users expeditiously, abiding the fourth law of Library Science. Academic world extended their empirical research in this regard in order to develop understanding about users resulting in a large body of information over last sixty years.

Research on user studies

Research on user studies dates back to (Bernal, 1948). Reviews of such literature were done by noted authorities from time to time (Menzel, 1960; Paisley, 1965; Dervin & Nilan, 1986; Jansen & Pooch, 2001). For the purpose of discussions here, such studies are seen through two lenses one lens focusing on the use of information (including resources) and the other lens focusing on the use of technology. The overall characteristics of such studies are highlighted here.

On information need and use of resources:

Broadly, studies in this group aimed to understand (i) what is the nature of information need of users and how generalized such needs are across various groups (ii) the pattern of use of various resources (iii) the patterns of use of electronic resources. Functional groups were of much interest here how groups like engineers, physicists use different types of resources such as patents, reports, journal articles etc. Empirical studies attempted to generalize the information needs of different groups such as scientists and engineers (Pinelli, 1991). Information proliferation gave rise not only to volume of information but also to the variety of information resources. The pattern of use of such variety of information resources, namely conventional books and journals and more special materials such as patents, standards, reports etc. by different groups of users became object of earlier studies. Clearly the issue was how to build a meaningful collection for a specific group. Such studies were extended to other non-task related groups such as retired persons, prisoners etc. (Chatman, 1999). In more recent past, these studies were extended to understand how use of certain types of resources can be institutionalized among certain groups. (Audunson, 1999).

This stream of study took a new turn in electronic age. With the availability of electronic journals and electronic books, the studies started looking more at the use pattern of such electronic materials compared to print resources. How electronic media was getting accepted by users was the focus of such studies. The challenge of that age was to understand
how electronic media would be accepted among users which would then be helpful in
decision making regarding transformation of print to digital world. Such studies also
included various groups such as medical faculty (Tenopir, 2004), scientists (Tenopir, 2003).
Some other studies involving various groups came from Brown (1999), Covi (1996), and
many others. Availability of usage statistics at more micro-level for these electronic materials
gave views of usage at more depth. Thus while earlier studies helped librarians to make
decisions on the varieties in collection, the latter studies helped to take decisions on
switching over from print to electronic media.

On interacting with systems:

The other stream of research focusing on using technology aimed to develop/fine-tune
the technology which can deliver information most efficiently and accurately. The term
technology is used here in a very broad sense. Any process that can organize and retrieve
information can be considered as technology. Thus manual information system can also be
considered as technology. However, with the advent of computerized information systems,
those studies were primarily oriented towards computerized systems.

Library technologies have witnessed great changes over the period of time. Such changes
have also affected the way users have been empowered to search and find information. The
first technology to enter the scenario was large vendor-supported computerized information
system such as Dialog, BRS etc. In seventies and eighties, large information retrieval systems
(ORBIT, DIALOG) were prevalent. More than end-users, trained intermediaries were regular
and frequent searchers of such systems on behalf of end-users. Studies in those days
attempted to understand the thought processes of users so that human intermediaries
could be more efficient in searching those information retrieval systems. Seventies witnessed
emergence of ILMSs, of which OPACs were a major service product. OPACs were used more
by less trained and less frequent users of the libraries. Researchers attempted to understand
how such OPACs were used compared to large information systems (Borgman, 1986). CD-
ROM technology brought large information systems in-house and the end-users were more
focused and frequent searchers. Finally, the web has changed the whole scenario. The web
has both standardized as well as non-standardized information system. Its users range from
very novice to highly trained and experienced users, from young to adult. The primary
objective of this stream of research was designing a system which would support the
information searching processes of such a wide variety of users. As web became a household
tool, user studies shifted the focus from very specific user groups such as engineers,
physicists to more general group such as school children using web for their homework
(Fidel, 1999) etc.

In this stream of research, scholars looked at various cognitive and affective aspects of
users while interacting with a system, by bringing different theories from disciplines like
psychology, education etc. They wanted to understand how individual differences can
intervene in the searching process. Findings of such studies highlighted on interface
designing, suggesting new features to the system and external support like training.

What are the current challenges and how such challenges shape user studies?

It is no doubt that Information & Communication technologies are now abundant,
compared to what it used to be even 10-15 years back. These technologies have empowered
users to have access to information in the way they prefer. Users are no more tied up to their
desk-top or lap-top computers to search and read information various mobile devices are
also available now for this purpose. They are now also empowered to create information
which was earlier the tasks of library professionals. For example, several researches have been
Conducted to understand if social tagging can complement subject indexing. In this scenario, study of users still remains very relevant in order to design new services in this new age and to better manage them. The quest for this understanding guides what should be the research agenda of user studies within a given environment.

Characteristics of today’s users are much different from what it used to be twenty years back. There is now a plethora of Information and Communication technologies at the disposal of common users. There are barriers still now but Internet is, comparatively accessible to larger population. The level of computer literacy is another important factor. All over the world, though with varying degree, people are getting exposure to computers at a very early age. Older people have also become exposed to computers due to various compulsions. Besides, platforms like facebook, twitter are adding to the pleasure of people of all ages and are also contributing to people becoming more computer savvy. Implementation of e-governance are mandating common citizens to adopt computer and Internet as part of their regular life. Different government policies in countries like India are contributing towards elevating the computer literacy level among information users at very early age. At the same time, school and college goers are getting more exposed to electronic information resources, thanks to various consortia across the world.

In bibliographical world, users are now having access to multiple resources. More and more publishers are digitizing their contents and selling the same as digital library to libraries across the world. Besides, open access movement has made many journals available which do not require subscription. While some users are becoming loyal to one specific system, some users are searching as many systems as required. In order to help this situation, meta-search engines are now available in the market. Federated search services, discovery systems are the newer products in the market, in addition to traditional databases.

However, a great rift has developed between bibliographical information systems such as library catalogue, search engines and other information platform such as Google. In a recent survey conducted by this author, it was found that many users prefer Google or Google Scholar for their information search as it is much easy to conduct search on this platform than any bibliographic system. Bibliographic world has adhered to many standards, over the years, to render data correctly but apparently it has not got acceptance among users to that extent. As Calhoune (2006) rightly noted that the Web, widespread ownership of computers and high computer literacy level have jointly a destabilizing effect on standard library tools and a large and growing number of students and scholars routinely bypass library catalogs in favour of other discovery tools, and the catalog represents a shrinking proportion of the universe of scholarly information. The catalog is in decline, its processes and structures are unsustainable, and change needs to be swift. These observations can be extended to any bibliographic systems which originated in the environment standard of strong standard and predefined search interface.

**Research Agenda in New Environment**

In the current scenario as described above, some of the probable questions that can be addressed are:

(i) What is user perception about “easy” to use? Is Google really that easy compared to some other bibliographic system? As interfaces and interaction mechanisms of many bibliographic systems have become simpler, how difficult those systems still are? Answer to questions in this line may help system developer to invest in developing new interfaces and search engines that matches the way users find them conducive.
(ii) Are users foregoing “relevance” for the sake of “ease”? The concept of relevance has a profound importance in Information science and user studies. We need to question whether benefit of relevance is same on Google as it is on other platforms.

(iii) How is the nature of reading habits of users changing in the current electronic environment? It has been reported by many studies that users simply download pages from the electronic versions and read them. While this is possible for some digital documents, for electronic documents which are more interactive in nature, such downloads may not be possible. Overall, has this change in environment had any effect on reading habits of users? How this habit is different for older generation from that of younger generation?

(iv) How web 2.0 tools are used by users in information searching and how these tools can be used in information dissemination? Findings of this question can lead to designing information services in a different way.

Conclusions

Understanding users in terms of information need, seeking and use has always been a challenge to librarians. Empirical research has been directed to this area for many years and will continue to be so. One of the reasons for such continuous interest is the rapid change in technological environment which has a destabilizing effect on traditional library services. Another reason is the characteristics of users, which is also evolving over time. Today’s bottom line is how to keep libraries relevant to the users. In order to do so, librarians need to understand the competitiveness and characteristics of technologies surrounding libraries and the characteristics of library users who are more technology savvy than the users of yesteryears. Questions like how these users interact with the current technologies to meet their information need, what is their perception about a technology, whether their information needs are met actually, how library services can come closer to their perception of a handy services must be addressed through user studies so that libraries can exploit contemporary technologies and design relevant services for today and future.

Marching with Mashup: Application of Information Mashup for Developing Open Library System

Parthasarathi Mukhopadhyay
Department of Library and Information Science,
The University of Burdwan, Burdwan 713 104
e-mail: psmukhopadhyay@gmail.com

Abstract: This paper reports the possibilities of developing open library systems, as proposed by Swartz, through the use of an array of open contents and appropriate on-the-fly integration mechanisms. Open contents may include a wide range of scholarly contents along with different associated objects like book cover images. Information mashup, a central focus of Web 2.0, may be applied for the purpose of achieving real-time integration of objects with library services.

Keywords: Open library systems; Open standards; Open contents; Open source; Interoperable library system; Information mashup

1. Introduction

Aaron Swartz, the first project leader of Open Library (OL) project, opined that open library will be a loosely federated network of local open libraries; agencies and committed individuals (Open Library Environment, 2009) to serve as a global central directory for digital knowledge objects (see http://www.archive.org). The OL project (the project is now led by George Oates) intended to create “one web page for every book ever published” (see http://openlibrary.org/). This paper is an attempt to expand the concept of OL through inclusion and integration of bibliographic resources and associated objects (available as open contents) with existing resources of a modern library of any type or size. The integration method is based on information mashup a central idea of Web 2.0.

A typical library system in India is characterized by three limiting factors i) resource optimization through subscription based access; ii) application of license-fee based software (commercial software in other words) for organizing resources and managing libraries; and iii) non-integration of open contents (may range from scholarly objects to cover images) with existing library resources. Recent changes in computer-mediated scholarly communication process and availability of open source software for almost every library activities gave birth to the concept of open libraries (Mukhopadhyay, 2011a). Open libraries are free from the clutches and limitations of traditional libraries. Open library (OL) is a new online tool to find out digital resources across the global retrieval systems in open and seamless ways. A model open library system has already been developed by the Internet Archive and available through URL openlibrary.org. But unfortunately this model open library neglected the possibility of integration open contents with resources available in the open library databases.

2. What is Open Library: Towards a Definition

Till date the concept of open library is a loosely defined concept. The OL project concentrates on four interlinked factors i) Books for the blind and dyslexic (special facilities
for physically challenged users); ii) Digital lending library (facilities for lending of books
collected from 150 libraries and many publishers); iii) Book database (a central bibliographic
database by merging records from the Library of Congress, other libraries, and Amazon.com,
as well as from user contributions through a Wiki-like interface); and iv) Technical framework
development of an open interactive framework for the above stated facilities)
(Mukhopadhyay, 2011b). However, if we try to expand these components in the context of a
library system in a developing country like us, there is a need to concentrate on parameters
that are not included in scope of open library (as propounded by the project). In a country
like India, the concept of OL should be characterized by three typical factors i) emphasis on
open contents as library resources, ii) reliance on open source software (OSS) and open
standards as tools for building and maintaining library services, and iii) increasing use of
mashup mechanisms to integrate open resources and services (Mukhopadhyay, 2010).

Now we may consider following set of major features for an open library system -

- Open library system is based on open contents, open source software and open
  standards. The goal is high degree of interoperability and at least one web page for
every knowledge object;

- Open library establishes a relationship with information stakeholders and the content
  providers like publishers, distributors, content providers, software vendors etc;

- Open library provides access to all forms scholarly communication with different
  levels of contents (bibliographic, authority, metadata, full-text and associated
  information e.g. cover page image/review/ToC in case of books); and

- Open library also provides interactive user interface to generate user-driven contents.

3. Components of Open Library System

Till date open library system is a conceptual entity. The foregoing section of this paper
proposed an array of features that leads to an open architecture for a library system. The
open library system requires following five interrelated and interacting components for
delivering new generation services to users.

3.1. Open Contents

This is the most valued components of an open library system. A futuristic library system
should use open contents judiciously, organize those objects efficiently and render processed
objects in an interactive environments. Open contents or open knowledge is a term used to
denote a set of principles and methodologies related to the production and distribution of
knowledge objects in an open manner. Here knowledge object is interpreted broadly to
include: i) Data (scientific, historical, geographic or otherwise); Contents (journal papers,
reports, books, music, films, images, audio file etc.); General information (produced by
government and other administrative bodies); and objects associated with existing library
resources (e.g. cover image, table-of-contents etc. of a book available in catalogue database).

3.2. Open Standards

On-the-fly or real-time integration of open contents with existing library materials can
only be achieved through interoperability. Interoperability, on the other hand relies upon
open standards. The W3C (2006) provides a set of six pack criteria in defining Open Standards
- transparency (due process is public, and all technical discussions, meeting minutes, are
archived and citable in decision making), relevance (new standardization is started upon due
analysis of the market needs, including requirements phase, e.g. accessibility, multilingual
features), openness (anybody can participate: industry, individual, public, government bodies,
academia, on a worldwide scale), impartiality and consensus (guaranteed fairness by the process and the neutral hosting of the W3C organization, with equal weight for each participant), availability (free access to the standard text, both during development and at final stage, translations, and clear IPR rules for implementation, allowing open source development in the case of Web technologies) and maintenance (ongoing process for testing, errata, revision, permanent access). Automated library systems and digital library systems are trying to be compatible with globally agreed upon standards related with information processing. Moreover libraries are now operating in a distributed networked environment. As a direct consequence of it, libraries reliance upon open standards to satisfy growing multidimensional user demands is increasing day-by-day.

3.3. Open Source Software

Adaptation of commercial software in library is not one-time capital expenditure but it leads to considerable recurring expenditure on already strained library budget. Recently, DLF-ILS Discovery Internet Task Group (ILS-DI) developed a set of Technical Recommendation for library software (Digital Library Federation, 2008). As per these recommendations library software systems should i) improve discovery and use of library resources; ii) support a clear set of expectations (framed systematically) for users (end users and power users) and developers; iii) be open and extensible for recommendations applicable to existing and future system requirements; iv) support interoperability, interoperation and cooperation; and vi) be responsive to the user and developer community (Mukhopadhyay, 2011). In view of these recommendations, open source software may be considered as most comprehensive software solution for different library activities.

3.4. Interoperability Framework

The basic purpose of interoperability is to exchange data with minimal loss of content functionality (Lagoze & Sompel, 2003). It is closely related with the crosswalk. A crosswalk is a mapping of the elements, semantics and syntax from one metadata schema or content designator to those of another. It allows bibliographic data or metadata created by one system to be used by another system that employs a different metadata standard or bibliographic format. Interoperability and crosswalk ensures exchange of bibliographic data among heterogeneous systems across the globe. There are three kinds of interoperability unstructured, semi-structured and structured. In a library setup, structured interoperability refers to distributed cataloguing (critical area in the domain of library automation) and metadata harvesting (important element in developing interoperable digital library). Unstructured and Semi-structured interoperability deals with on-the-fly integration of globally available open contents with locally processed library resources and services.

3.5. Users as Contributors

Web 2.0 is based on interaction, collaboration and participation. In such an environment users are considered as the most-valued contributors. It follows the principle user-at-centre stage. As a result, Web 2.0-enabled services consider users as co-developers. Open library system is banking on this generic principle of participative architecture. Libraries are now giving users facilities to interact with the system through interfaces like content ratings, item review, folsonomy (tags are now given by users for resource description), blog posting etc.

4. Information Mashup Processes

Information mashup tools allow remixing of data, technologies or services from different online sources to create new hybrid services (O’Reilly, 2005) through lightweight application programming interface (API). This paper reports the application of information mashup in
managing and integrating virtual open contents distributed globally with local library resources. Information mashup are becoming popular application of Web 2.0 around the world such as Kohaz on (integration of Koha OPAC with Amazon services), Unthirsty (a combination of Google Maps and Happy hour finder, which shows the nearest happy hour place against user query), Wikibios (a mashup where user can create online biographies of each other in a Wiki setup), LibraryLookup (integration of Google maps with library directory service in UK), Go-Go-Google-Gadget (Ann Arbor District Library’s effort for integration of library OPAC with personalized homepage service offered by Google) and many other similar services. Information mashup may be considered as a powerful tool for achieving the ILS-DI recommendations (as reported in section 3.3). The mashup processes can be applied effectively for integration of open contents with locally located library resources at the time of serving these resources through library OPAC. Moreover, a structured approach may help libraries to utilize mashup mechanisms for discovering, harvesting and storage of global resources for serving locally. The processes of information mashup, on the basis of complexity levels, may be categorized as follows:

<table>
<thead>
<tr>
<th>Basic mashup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Widget based mashup</td>
</tr>
<tr>
<td>Map mashup</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Intermediate</th>
</tr>
</thead>
<tbody>

<tr>
<td>Working with a mashup aware editor (ex: Yahoo Pipes)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Advanced</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working with Web Services</td>
</tr>
<tr>
<td>Working with Application Programming Interfaces (APIs)</td>
</tr>
<tr>
<td>Building mashable contents from libraries</td>
</tr>
</tbody>
</table>

5. Services though Information Mashup

In a library setup, structured information mashup (termed as advanced mashup in section 4) refers to distributed cataloguing (a critical area in the domain of library automation) and...
metadata harvesting (important element in developing interoperable digital library). Unstructured (referred as Basic mashup) and Semi-structured (grouped as Intermediate mashup) information mashup deals with on-the-fly integration of globally available open contents with locally processed library resources and services.

5.1. Unstructured Interoperability

This type of interoperability may be considered as low level integration of two or more different sources and/or services to cater a new service e.g. library OPAC or homepage may integrate location map (such as Google maps) for providing transport direction (Fig. 1). In most of these cases integration occurs through a utility called Widget. For example, the library OPAC of the department of library and information science, the University of Burdwan includes a custom search engine through Widget (Fig. 2).

5.2. Semi Structured Interoperability

These are considered as medium level integration of library resources with open contents. Here integration is based on some sort of matching rule to relate a library resource (e.g. book or journal) with associated additional information bearing objects (e.g. cover image or table-of-contents) available in the public domain. For example, a book in catalogue database of a library may be integrated on-the-fly with Amazon or Google book jacket services on the
basis of title-ISBN matching rule (Mukhopadhyay, 2006). Similarly, a book can be integrated with table-of-content service of the Library of Congress (CatDir) for providing additional dataset to users (Fig. 3).

These two types of interoperability are also called information mashup in Web 2.0 terminology (Riewe, 2008). A mashup, by definition, is a web application that uses content from more than one source to create a new service.

5.3. Structured Interoperability

The structured interoperability in library domain is dominated by two standards Z 39.50 (developed by ANSI/NISO) and OAI/PMH (produced by Open Archive Initiative). However, a series of open standards are developed by Library of Congress on the top of Z39.50 or OAI/PMH to achieve structured interoperability such as SRU, SRW, METS and MODS. Although the primary aim of all of these standards to support exchange of bibliographic data in heterogeneous environment, the major two standards i.e. Z 39.50 and OAI/PMH differ significantly in view of the working mechanism. The similarities and differences are as follows

<table>
<thead>
<tr>
<th>Similarity</th>
<th>Z 39.50</th>
<th>OAI/PMH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content (Objects)</td>
<td>Distributed</td>
<td>Distributed</td>
</tr>
<tr>
<td>World View</td>
<td>Bibliographic</td>
<td>Bibliographic</td>
</tr>
<tr>
<td>Object Presentation</td>
<td>Data provider (Target -&gt; Origin)</td>
<td>Data provider (Service provider)</td>
</tr>
<tr>
<td>Searching is</td>
<td>Distributed</td>
<td>Centralized</td>
</tr>
<tr>
<td>Search done by</td>
<td>Data provider</td>
<td>Service provider</td>
</tr>
<tr>
<td>Metadata searching</td>
<td>Up to date</td>
<td>Stale</td>
</tr>
</tbody>
</table>

This research work shows path to utilize Z 39.50 protocol to snatch bibliographic records from an array of Z 39.50 servers in the local catalogue editor. The system uses Koha ILS (with

Figure 4: Z 39.50 search in Koha ILS
in built Z 39.50 client, called origin in the standard) and IRSpy global database of bibliographic servers (irspy.indexdata.com). A Z39.50 compliant ILS requires some server specific data (like host address, port number, database name etc.) to link client with server for getting required bibliographic records. IRSpy provides a directory of Z 39.50 servers (with necessary details) available across the globe. Cataloguers may conduct Z 39.50 search session from the catalogue editor of Koha (see Fig. 4).

Interestingly, with the latest release of Koha (Version 3.23 onwards) a library may provide bibliographic data as Z 39.50 server (called target in the standard) to others without installing any additional software.

In the digital library domain interoperability may be achieved through a standard protocol called OAI/PMH. The OAI/PMH is a light-weight standard protocol for harvesting metadata records from 'data providers' to 'service providers' (Fig. 5). It provides some rules (six verbs) to harvest the metadata by service provider from a repository (data provider) not the full content. The contents should be retrieved from source repositories (Lagoze & Sompel, 2003).

For example, this research work developed a localized search service for OAI/PMH-compliant repositories in LIS domain available globally. This single-window search facility (named as Unilis) so far harvested metadata of around ten thousand open access scholarly

![Figure 5: Metadata harvesting through OAI/PMH](image)

![Figure 6: Digital library through harvesting](image)
materials from eighteen repositories that include pre/post print version of journal articles, theses, reports, learning objects, slide presentations etc (Sarkar & Mukhopadhyay, 2010). It supports localized searching of metadata elements in two modes simple and advance (Fig. 6). Users can limit search in a single repository or a group of repositories (by default a given search session includes all the available repositories). Search can be filtered by DC metadata elements like title, author, date range, language etc. UniLIS can harvest metadata from DCMES (Simple DC metadata), MARC 21 Bibliographic Format and ETD-MS (metadata for electronic theses and dissertations).

6. Conclusion

Open contents and information mashup together can do miracle for designing and developing new generation library services. The concept of open library is not yet a matured one. In fact the concept is still very much in research bed. However, this paper demonstrates a personal view of the author as far as the concept of open library is concerned. In future, semantic web technologies may add a new layer in identification, organization, integration and on-the-fly dissemination of open contents through a single window search interface for users.

Applications of Management Information System in an Organization

Subarna Kr. Das
Dept. of Library and Information Science
Jadavpur University, Kolkata-700032

Present paper attempts to highlights different aspects of MIS and its application, merits and demerits in an Organization in the changing context of modern organizations.

0 Meaning

MIS is the very familiar concept in the field of management science and it has the interdisciplinary approach. MIS is mainly concerned with processing data into information which is to be instantly communicated to the various wings in an organization for making appropriate decision. Any MIS can provide information which is needed to manage organizations effectively and efficiently. Management Information Systems are distinct from other information system. The term MIS is commonly used to refer to the group of information management methods tied to the automation or support of human decision making e.g. Decision Support System, Experts Systems and Executive Information systems. They can be used successfully to facilitate access to a wide range of integrated data set. They are consistent, modular and flexible tools for the systematic acquisition; analysis and archiving of data and information from a variety of sources MIS can become more powerful tool for planning and decision making, quality control, standardization and regular updating are the key issue to ensure the usefulness of MIS.

1. History

Kenneth and Jane Loudon identify five eras of MIS evolution corresponding to five phases in the development of computing technology: 1) mainframe and minicomputer computing, 2) personal computers, 3) client/server networks, 4) enterprise computing, and 5) cloud computing. The first (mainframe and minicomputer) era was ruled by IBM and their mainframe computers; these computers would often take up whole rooms and require teams to run them, IBM supplied the hardware and the software. The second (personal computer) era began in 1965 as microprocessors started to compete with mainframes and minicomputers and accelerated the process of decentralizing computing power from large data centers to smaller offices. In the late 1970s minicomputer technology gave way to personal computers and relatively low cost computers were becoming mass market commodities, allowing businesses to provide their employees access to computing power that ten years before would have cost tens of thousands of dollars. The fourth (enterprise) era enabled by high speed networks, tied all aspects of the business enterprise together offering rich information access encompassing the complete management structure.

2. Objectives

MIS are precious and costly assets, and require detailed planning if their design, implementation and operation are to be successful. The adequate introduction and
performance of MIS require that they built on already existing elements, and ensure consultation and coordination with all stakeholders. A key issue for the application of MIS is open distribution of information, providing each of the actors with the same basic overview and synthesis.

Major objectives of MIS are to:

1. Reach an understanding of the relevant Processes on the basis of the available historic information. This element forms the basis for the development of models, required for forecasting and simulation.
2. Provide information on the current situation, especially for early warning purposes, for instance related to issues impacting on food security, water resources or pest and disease status.
3. Forecast changes and impacts, either natural or man-made, as an element in vulnerability assessments.

Forecast the consequences of policy decisions and measures before they are implemented in reality. This implies evaluating options for several given scenarios based on the possible results and predicted consequences and selecting the most acceptable alternative.

3. Management Sub structure

Most management information systems specialize in particular commercial and industrial sectors, aspects of the enterprise, or management substructure.

- **Management information systems (MIS)**, Regularly scheduled reports based on data extracted and summarized from the firm's underlying transaction processing systems to middle and operational level managers to identify and inform structured and semi-structured decision problems.

- **Decision support systems (DSS)** are computer program application used by middle management to compile information from a wide range of sources to support problem solving and decision making.

- **Executive information systems (ELS)** is a reporting tool that provides quick access to summarized reports coming from all company levels and departments such as accounting, human resources and operations.

- **Marketing information systems** are MIS designed specifically for managing the marketing aspects of the business.

- **Office automation systems (OAS)** support communication and productivity in the enterprise by automating work flow and eliminating bottlenecks. OAS may be implemented at any and all levels of management.

4. MIS Application

MIS application should meet criteria relating to:

- Timeliness
- Completeness
- Reliability
- Availability
Accessibility
Cost-effectiveness

5. Enterprise applications

- **Enterprise resource planning (ERP)** systems provide an organization with integrated software modules and a unified database which enable efficient planning, managing, and controlling of the core business processes across multiple locations. Modules of ERP systems may include finance, accounting, marketing, human resources, production, inventory management and distribution.

- **Supply chain management (SCM)** systems enable more efficient management of the supply chain by integrating the links in a supply chain. This may include suppliers, manufacturer, wholesalers, retailers and final customers.

- **Customer relationship management (CRM)** systems help businesses manage relationships with potential and current customers and business partners across marketing, sales and service.

- **Knowledge management system (KMS)** helps organizations facilitate the collection, recording organization, retrieval, and dissemination of knowledge. This may include documents, accounting records, and unrecorded procedures, practices and skills.

6. Advantages

The following are some of the benefits that can be attained for different types of management information systems.

- Companies are able to highlight their strengths and weaknesses due to the presence
of revenue reports, employees' performance record etc. The identification of these aspects can help the company improve their business processes and operation.

- Giving an overall picture of the company and acting as a communication and planning tool.
- The availability of the customer data and feedback can help the company to align their business processes according to the needs of the customers. The effective management of customer data can help the company to perform direct marketing and promotion activities.
- Information is considered to be an important asset for any company in the modern competitive world. The consumer buying trends and behaviors can be predicted by the analysis of sales and revenue reports from each operating region of the company.
- A good MIS will offer significant time savings and efficiency gains.
- A good MIS will deliver measurable cost savings and improved profits.
- MIS will give business owners the information they need to map the future of their business.
- It Facilitates planning: MIS improves the quality of plants by providing relevant information for sound decision making. Due to increase in the size and complexity of organizations, managers have lost personal contact with the scene of operations.
- In Minimizes information overload: MIS change the larger amount of data into summarized form and thereby avoids the confusion which may arise when managers are flooded with detailed facts.
- MIS Encourages Decentralization: Decentralization of authority is possible when there is a system for monitoring operations at lower levels. MIS is successfully used for measuring performance and making necessary change in the organizational plans and procedures.
- It brings Coordination: MIS facilities integration of specialized activities by keeping each department aware of the problem and requirements of other departments. It connects all decision centers in the organization.
- It makes control easier: MIS serves as a link between managerial planning and control. It improves the ability of management to evaluate and improve performance. The used computers has increased the data processing and storage capabilities and reduced the cost.
- MIS assembles, process, stores, retrieves, evaluates and disseminates the information.

7. Disadvantages

There are some disadvantages of MIS, which may cause problems for its applications. Information systems may not always function properly. This happens for a number of reasons. Systems break down, interrupting smooth operations and causing customer dissatisfaction. For instance, customers may be charged for the wrong services or for merchandise that they did not order. Also, defective information systems can deliver the wrong information to other systems, which could create further problems for the company and its customers. Furthermore, systems are vulnerable to hackers and fraud.
8. Conclusion

Following things is to be consider when we are thinking about good MIS and its applications in an organization. MIS should have the following attributes

- System capability,
- Modularity
- Simple
- Transparent
- Instinctive
- Online capability
- Integration
- Support from well established and committed supplier

Library as an Open System
Institutional Repository at IACS in the context of National Open Access Initiatives: A Status Report

Swapan Deoghuria \textsuperscript{1*} and Swastik Sinha \textsuperscript{2}

\textit{Indian Association for the Cultivation of Science}
\textit{Kolkata 700032, India}

Email: \textsuperscript{1}ccsd@iacs.res.in, \textsuperscript{2}ccss@iacs.res.in

Abstract: The objective of this paper is to share the experiences of setting up an institutional repository (IR) at the Indian Association for the Cultivation of Science (IACS), a premier research institute in India. We focused on some of the key issues that it was necessary to consider, the choices made and the challenges overcome.

1. Introduction

A n IR is an electronic system capable of capturing, preserving, and providing access to the intellectual (digital) output produced by the members of an institution \cite{1, 2}. In an academic institute, an IR may provide a place for faculty work, student theses and dissertations, e-journals, datasets and so on. An institution can use its IR as main vehicle to showcase its scholarly output \cite{2} in a centralized and systematic way.

IACS is one of the most prestigious research institutes in India where Sir C. V. Raman worked during 1907 to 1933 on various topics of Physics making discovery of the celebrated effect on scattering of light in 1928, which bears his name and that brought many accolades including the Nobel Prize in 1930. The American Chemical Society designated the Raman Effect as an International Historic Chemical Landmark in 1998.

IACS implemented its IR using DSpace open-source software in the line of recommendation of the NKRC (National Knowledge Resource Consortium) for all DST & CSIR Labs. The IR (http://arxiv.iacs.res.in:8080/) has been designed and being maintained by the Computer centre of IACS. The same is interoperable through Handle Server. The staff members of IACS library are actively engaged in approval process of submitted articles in the IR and document collection. IACS IR is one of the state-of-the-art IRs in India and it is composed of the following classes of resources under each community:

1. Peer Reviewed Articles (Pre & Post print)
2. Conference & Seminar Proceedings
3. Annual Reports/Technical Reports
4. Invited Lectures
5. ETD (Electronic Thesis & Dissertation)
There are 17 Communities in IACS IR. Apart from the 13 research departments/units, we included Computer Centre, Journal Publications, Library & Information Science and Reports as separate community as we feel that these communities will also contribute to the IR. The research departments/units are given below:

- Biological Chemistry
- Centre for Advanced Materials
- Energy Research Unit
- Inorganic Chemistry
- Mahendra Lal Sircar Professor's Unit
- Materials Science
- Organic Chemistry
- Physical Chemistry
- Polymer Science Unit
- Raman Center for Atomic, Molecular and Optical Sciences
- Solid State Physics
- Spectroscopy
- Theoretical Physics

The IR is registered with DSpace. There is a plan to digitize all its archival documents and to include those in the IR like Journal Articles of Indian Journal of Physics (IJP) & IACS Proceedings, Annual Reports, Special Publications & Books of immense archival values way back from 1900s. Already nearly 70,000 pages of archival documents have been digitized in the library and are in the pipeline for inclusion to the IR. It is expected that the scholarly community of the nation will be enriched when the IR of the IACS will be fully populated.

1.1 Aims and Objectives

IRs have emerged along side the Open Access to scientific literature movement that means free, online access to digital scholarly materials, primarily peer-reviewed research papers but also other types of digital content that authors wish to make freely available to all users online. Self-archiving peer-reviewed journal articles in institutional repositories is one of two pathways to Open Access as defined in the Budapest Open Access Initiative (the other being publication in Open Access journals), and self-archiving in repositories is often considered the most effective and the quickest to attain [3].

The Computer Centre of IACS has embraced the Open Access movement and engaged in the implementation and promotion of its own institutional repository. The primary goals for the repository are:

- Maximise the impact of the research carried out at the institution;
- Preserve the intellectual memory of IACS already produced and being produced in digital forms; and
- Accelerate the progress of science.

The saying “if you build it, they will come” failed for IACS IR also [4]. Implementing an IR is not as simple as just installing repository software and making the repository accessible to its
potential users. As studied earlier [5] adoption is slow for IACS IR mainly due to the following reasons [6,7]:

Users do not generally perceive the potential benefits that may arise from using such a system.

Users are extremely careful regarding what concerns publisher rights.

Some researchers recognize technology as a barrier in the use of IR.

Researchers feel that self-archiving is an additional task and they are already overburdened with their usual research work.

As debate is going on [8] whether success of IR is dependent on mandates or not, at IACS we are trying to overcome the problems of slow adoption and low deposit rate by committing to the following set of measures as studied earlier [4] that looked at carrots (promotional plan, incentive etc.) and sticks (mandates):

1) a thorough promotional plan for researchers;
2) developing value-added services for repository users;
3) engaging with the international community; and
4) to convince the authority to implement a mandated self-archiving policy as well as offering a incentive to promote self-archiving.

We already studied [7] through a survey about the attitude of scientists regarding Open Access. It helps us for implementation of IACS IR. The acquired experience and the results obtained with the implementation of these measures are worth sharing with the general community. In this article we will provide an overview of the implementation process of IACS IR and describe the most effective measures that were conducted to achieve what we consider to be a successful IR implementation. We will also unveil some of the ideas for future initiatives that will soon be put to practice at IACS that aim to further increase the adoption of our institutional repository.

2. Starting Out

Conscious of the developments in open access publishing and proponent of Open Access movement, the Computer Centre at IACS had been interested in developing an IR for some time. In 2009 we started a pilot project when two young staff members joined this Centre with a PC. After initial study with different IR software we decided to work with DSpace due to different advantages compared with other IR software. The things got a final shape when the Director of IACS instructed the Computer Centre to launch its official IR in a meeting of the Library Committee held on September 6, 2010. The same was launched on November 12, 2010 and announced to all researchers of IACS for registration and subsequent submitting of their research output. The IACS IR is registered with the handle server (http://handle.net) on April 12, 2011 and after that the IACS IR got fully qualified domain name (http://hdl.handle.net/10821/52) and it is interoperable. As recommended by the Advisory Committee for the Computer Centre a link for IACS IR is available in the homepage of IACS Website for easy access. The H/W and S/W used in different phases are given in Table 1.

The Fig 1 shows the submission of content in IACS IR during the last few months after announcement to the internal users and made it to the public.
In Fig. 2 it is established that IACS IR is visible to global users and accessed from all corners of the globe. As the IACS website is search friendly [9], the IACS IR is also easily searchable. We expect large access rate once it will be moderately populated.

In Fig. 3 we see that although IACS IR is less populated but it is widely accessed as its contents are rich and searchable through search queries.

### 4. Conclusion and future Scope

IT & library professionals and Archivists are trying for quite some time to convince the researchers about the potential benefits of IR. Various awareness-raising and advocacy efforts were done from the Computer Centre of IACS. But it is the National Initiatives like National Knowledge Commission (NKC), National Knowledge Network (NKN), National Knowledge Resource Consortium (NKRC) etc. that prompted the IACS authority to launch its own IR. The IACS IR is launched and visible for almost one year but we feel that many academics are either unaware of IACS IR, or are aware of its existence but remain detached from it. We received a number of suggestions from authors during formal and informal meetings with them. The scientists at IACS want to publish their research output only in journals with international repute with high impact factor like many scientists elsewhere. Once submitted or published their research output in journals they are concerned about copyright issues and they do not want to submit the preprint or post-print copy of the same in the fear of violating copyright. They feel that only the final version of the article published in journals with journal logo can bring the professional recognition for them. A faculty-centric approach to the design and marketing of repositories is the need of the time to make IR successful. If properly aligned with the existing practices of faculty, IRs have the potential to fulfill many of their so far unmet expectations.
Acknowledgement

The authors gratefully acknowledge the wholehearted support and encouragement of Prof. Kankan Bhattacharyya, Director, IACS to launch its official IR.

Abstract: This paper discusses the open accessibility of bibliographic databases with a case study of nuclear safety and environment related publications in Open access INIS database. The study subsequently conducted a bibliographic analysis of the 37874 research papers published during 1970 to December 2010. The average number of publications published per year was 902. The highest number of papers 1599 was published in 1995. The study also shows the growth pattern of the subject in the period of study. The spurt in the literature output was reported during 1994-1999. There were 139 countries involved in the research in this field. USA is the top producing country followed by Germany, France, United Kingdom and Japan. The present study also shows the collaborative pattern of countries in the world. There were 857 international collaborative papers and produced 2051. Scientific and technical Reports were the most predominant channel of communication where more than 34% of the publications were published, followed by Journal articles (25%), Books (18%) and Miscellaneous which includes conference proceedings, patents, computer-media, films etc are 2%. That means more than 52% of all publications are Non Conventional Literature (NCL) that is not available in commercial market. The most preferred journals by the researchers were: Transactions-of-the-American-Nuclear-Society-USA, and Genshiryoku-Anzen-linkai-Geppo-Japan.

Introduction

Safe-operated nuclear power plants do not release contaminants into the environment. Obviously has an abiding interest in the safety and future of nuclear power generally (Berkowitz et al 2006). Nuclear safety covers the actions taken to avoid nuclear and radiation accidents or to control the consequences thereafter. This covers nuclear power plants as well as all other nuclear facilities, the transportation of nuclear materials, and the use and storage of nuclear materials for medical, power, industry, and military uses. [Jacobson et al 2010]. During the past 50 years there are only three major nuclear related incidents happened all over the world. Three Mile Island (1979) accident, accident took place at the Chernobyl (26 April 1986) Nuclear Power Plant in Ukraine, and lately the Fukushima (March 2011) Nuclear Power Plant in Japan, built in the 1970s, got affected due to a worst earthquake and 7 meter tsunami. The nuclear research institutions, organisations, and funding agencies have improved the safety and performance of reactors, and have proposed new safer reactor designs. Maintaining public health and environmental safety is a major requirement for the use of nuclear power for electrical energy generation in worldwide. Nuclear safety and environmental aspects of the reactors has become more relevant after Fukushima accident. There has been systematic evaluations to review the safety aspect of all the reactor around the world and the environmental monitoring, safety is taken more seriously than ever.
Research publications are clearly one of the quantitative measures for the basic research activity in a country [Chidambaram 2005]. Evaluation is one of the important components of any R&D activity. Productivity indicator of the research is the number of publications produced by the scientists, institutions and the country. Analysis of publications provide some insight into the complex dynamics of research activity and enables policy makers and science administrators in framing policies and directions in which research has to be conducted. Many bibliometric and scientometric studies have appeared in the literature to focus on the performance of nuclear science and technology [Anil Kumar et al, 2011a, 2011b; Vijai Kumar et al, 2004; Swarna et al 2002; Tibor Braun et al, 2000]

Open access means that a reader of a scientific publication can read it over Internet, download and even further distribute for non-commercial purposes without any payment or restriction and by the year 2000, there was an increase in open access publications [Prakasan et al, 2009]. R&D Policy makers around the world have recommended mandating that researchers provide open access to their research articles by self-archiving them free for all on the Web [Harnad, 2004]. The open access to either the full-text or the bibliographic details of the publications are boon to the research community as they represent the already research done and also give the current status of the research in a particular area. The open accessibility to such databases makes a positive impact on the availability of the scientific literature and can explain the increase in citations and impact [Bjork, 2010]. The present study discusses the open access nature of the INIS (International Nuclear Information System) database, a bibliographic database operated by IAEA, Vienna in the field of peaceful uses of nuclear science and technology. It is free, open and unrestricted access to Internet users around the world since 2009. More than 8% of records (2,80,000 records) in the online version of the INIS database has the full text availability. The study focuses only the nuclear safety and environmental publications in the INIS Database. The main objective of the study is to present the growth of world literature on nuclear safety and environmental aspects of the nuclear plants and make the quantitative assessment of status of the research by way of analyzing the following features of research output:

- annual growth of publications,
- geographical distribution of research output,
- channels of communication used by the scientists,
- journal-wise productivity
- Subject category in INIS database
- high frequency subject categories with top keywords appeared in the Descriptor Assigned by Indexers (DEI) field

**Materials and methods**

Data was collected from the INIS database (DVD-ROM version) during 1970-2011. A total of 37,874 records were downloaded for the period 1970-2011 and analyzed as per objectives of the study. By using suitable search strategy “ ( ( ( (nuclear safety or radiation safety or radiation protection or environment* protection or environment* safety or environment* impact* or environment* effect*) in TI) or ( nuclear safety or radiation safety or radiation protection or environment* protection or environment* safety or environment* impact* or environment* effect*) in ab) or ( nuclear safety or radiation safety or radiation protection or environment* protection or environment* safety or environment* impact* or environment* effect*) in de)) and (
Results and Discussion

Annual growth of publications

During 1970-2011 a total of 37,874 publications were published on nuclear safety and environmental aspects by various countries. The average number of publications produced per year was 902. The highest number of publications 1599 were produced in 1995. Figure 1 gives annual growth trend in the subject.

![Publication productivity of nuclear safety and environmental research as per INIS (1970-2011)](image)

It can be clearly visualized from the figure that growth of the literature was very slow during 1970-1975 and all of a sudden it peaked during 1994-1999 indicates that research on nuclear safety and environmental aspects received a major boost during this period. Table 1 shows more than 53% publications produced during 1994-2011.

Geographical distribution of research

There were as many as 139 countries carrying out research in the field of nuclear safety and environmental effects and they produced 25464 authorships and 17305 publications have no country affiliation. Figure 2 represents 22 countries whose share in the research output is more than 1 percent of the total output and spread of authorships. USA is the top producing country with 4845 (19.03%) authorships of the total output, followed by Germany with 2228 (8.75%), France with 2125 (8.35%), United Kingdom with 1743 (6.84%), Japan with 1737 (6.82%), Russian Federation with 857 (3.37%), Canada with 764 (3%), Sweden with 740 (2.91%), IAEA 786 (3.09%), and India with 651 (2.56%). Figure-2 shows the authorships produced by top twenty two countries.

International collaboration

The Information Communication Technology made an impact on scientific communication and that effected the collaborative research projects and related activities. Every country has realized the importance of collaborative research to tackle many scientific problems and resulted in more international collaboration. Table 2 provides international collaboration pattern of nuclear safety and environmental research in the INIS (1970-2011).

</table>
collaboration pattern in nuclear safety and environmental research. There were 857 international collaborative papers. Bilateral collaboration accounted for 65.8 percent of total collaborative papers followed by trilateral collaborative papers with 16.1 percent. There were collaborative papers with as many as eleven countries.

Figure 3a-3d. Depicts the visual representation of bilateral collaboration of most collaborated countries viz. USA (588), France (110), UK (106), and Germany (101) have collaborated with maximum number of authorship.

Types of Publication Media

INIS: guide to bibliographic description was used to group the records according to their publication media. Out of the 37874 publications, 12754 (34%) were scientific and technical reports, 9497 (25%) were journal articles, 8170 (21%) were books, 6944 (18%) were published as conference/symposium papers, and 509 (2%) were other publication media like theses, dissertations, patents, films, etc.

Comparison of publication of nuclear safety and environmental related research in terms of their publication media are given in figure 4. The number of conferences/symposia/seminars, etc. held with nuclear reactors and environmental safety as the theme, was high during 2000-2011. It is interesting to note the high percentage of Non-Conventional Literature (NCL) which includes technical reports; conference/symposia/seminar papers;
theses; dissertations, etc. (more than 52% publications as given in table 3). The high proportion of NCL may be due to urgency of communication to the targeted audience (Swarna et al 2002).

Journal-wise Productivity

For the past 2-3 decades statisticians have focused their studies on journal articles since they form a major share of peer reviewed and quality scientific research output. In the present study, it is found that 1599 distinct journals were used to publish 9497 publications (25.08%) out of a total of 37874 publications. Table 4 documents journals (having at least 41 publications) preferred by nuclear safety researchers. The high profile nuclear safety and environmental effect related five core journals are: Transactions of the American Nuclear Society (USA), Genshiryoku Anzenlinkai Geppo (Japan), Atw. Internationale Zeitschrift fuer Kernenergie (Germany), IAEA Bulletin (IAEA), Atomnaya Ehnergiya (USSR).

Subject category in INIS database

Figure 5 shows 15 broad subject categories in the field of nuclear safety and environmental effect. Number of publications prominently falls under ‘nuclear reactors and associated plants’ category were 8322 followed by Environmental safety (8315); Radioactive

waste management facilities related safety (7457); Life sciences, nuclear medicine, Radiation protection and dosimetry (5307); General aspect of nuclear safety (2189) publications [INIS]

Figure 5. Sub-categories in the field of nuclear safety and environmental research as per INIS classification scheme
Distribution of keywords

Keywords are one of the best scientometric and bibliometric indicators to understand and grasp instantaneously the thought content of the papers and to find out the growth of the subject field. By analyzing the keywords, one gets an idea about different terminologies used by researchers, indexers and about the direction in which the subject is growing. The high frequency keywords will enable us to understand all the aspects of nuclear safety and environment which have been studied. The keywords appeared in the DEI field in INIS database were analysed for the purpose. The high frequency keywords were 'radiation-protection' (15803), 'environmental-impacts' (9140), 'nuclear-power-plants' (6930), 'radioactive-waste-disposal' (4998), 'radiation-doses' (4247), and radioactive-waste-management (4124). The numbers in the parenthesis are the number of times that keyword is appeared in the DEI field. Figure 5 gives 20 most appeared keywords.

![Figure 6. Top 20 keywords appeared in the nuclear safety and environmental research Publications in the DEI field in the INIS database (1970-2011)](image)

Conclusion

The internet era has seen a tremendous rise in the number of open access initiatives which has not only provided easy access to the scientific literature but has also increased the impact of the research findings. A number of initiatives and declarations have been made in favor of open access which itself suggests the popularity of open access in modern research [Lal and Lal, 2011]. The results of the present study are of at most important for those who dealing with nuclear safety and environmental effects. The 1994-1999 period witnessed a peak in number of publications in the field of nuclear safety.

USA has done a lot of research in the area and their number of publications is far ahead from other countries pursuing intense research in the field like Germany, France, and United Kingdom etc. The bilateral international collaboration of countries involved in the field amounts more than 65 percentage of all internationally collaborated authorships and trilateral collaborations is only 16 percentages. USA, France, UK, and Germany have collaborated with maximum number of papers. Reports are the most preferred media of publication for communicating the research results. It is very noteworthy that, more than 52 percentage of the publications in the field are published as Non-Conventional Literature and most of the full text of these publications are available with INIS Database. Transactions of the American Nuclear Society and Genshiryoku Anzen linkai Geppo are identified as the most published journals in the field. Keywords provided by the indexer of the publications give an
insight to the trend of the subject content studied in these area of research. The most appeared five keywords are: 'radiation-protection', 'environmental-impacts', 'nuclear-power-plants', 'radioactive-waste-disposal', 'radiation-doses', and 'nuclear safety'.

Manpower Management and Development
Challenges-Threats and Opportunities in Biomedical Digital Knowledge Management and Role of Library and Information Science Professionals in India: A Pilot Study

Surya Nath Singh
National Institute of Virology (ICMR)
Pune-411001 (INDIA)
E-Mail: snsingh@niv.co.in; singh.sn@niv.co.in

Abstract: Technology has made tremendous impact on every profession and librarianship is no exception to it. Paper gives an overview of knowledge management, digital changes, knowledge society and changing role of Library and Information Science professionals in general and biomedical Information Centre and Library staff in particular in digital era. It argues/raises various issues and underlines their implications and challenges due to various aspects of digitization of knowledge and suggests how LISc professionals play an important role in overcoming the digital divide, and makes reference to the Global Knowledge Partnership. The article deliberates needs, relevances, and major challenges of digital knowledge management. It also highlights some of the major challenges faced by the biomedical Information Centres and libraries in India. The various concepts of SWOT in relation to LISc have been highlighted. It describes the varieties of new opportunities opened up in the past decade and there are high demands in each and every pure, applied and interdisciplinary area like biomedicine. It also describes various aspects of information use on LISc, in transition period of hybrid library. It emphasizes digital information and web based library services initiatives. This study is a pilot part of proposed depth study based on author’s experience, data available in different sources and also earlier studies carried out by others. To understand the current situation with electronic resources, librarians need to have an understanding of how user located information in past and how technological changes have altered these processes.

Keywords: Library and Information Science, Profession, Vision, Role, Challenges, Opportunities, Developments, out sourcing, SWOT, Information and Communication Technology, Digitization.

1.0. Introduction

“As a general rule, the most successful man in life is who has the best information.” Knowledge/Information is a fourth resource after 3Ms i.e. Money, Manpower Machine, and Material. Pinpointed, expeditious and exhaustive access of information is essential for quality decision making. However, there are various issues arises and challenges faced by LISc profession for knowledge management (KM), which has been defined as, “The system and managerial approach to collect, to process and to organize enterprise specific knowledge assets for business functions and decision making.” The scenario in LISc profession has changed from collection development to KM via collection management. The future of LISc profession is a matter of concern as it is full of challenges-threats and opportunities in the changing scenario, where everything is going to via digital technology and available through the Internet, where many others are in this expertise to take over KM as their career. Consequently, LISc professionals must extend their expertise beyond collection development to KM to offer value added information services with the help of modern IT. In the changing
scenario of information revolution, globalization and competitiveness, the KM has become an essential requirement for the survival, where concept of creation, capture, organization access, sharing and use are involved. Electronic technologies and KM are two top concerns of LiSc profession today.

1.1.1. Biomedicine and Biomedical Communication

Biomedicine is one of specialized branches of higher education and research, where everything is related to life, death, public health and hygiene as well as tremendous amount of research associated knowledge is generated. Biomedical LiSc professionals are facing many challenges/problems in the communication of information due to availability of information in various form and format as well as changing hardware and software, very frequently, geographical location, language, and fast changing nature of information as well as behaviours of user, etc. They are overwhelmed by his/her information however, cannot locate a particular information, when, why and how they need. Biomedical authorities, research organizations, educational institutions, hospitals, other medical/paramedical organizations, commercial enterprises, and mass media all deliver health and medical communication in different forms means, media for various purposes. With such a vast amount of biomedical and clinical information available, any action to ensure the spread of clinically relevant news items is welcomed. The technological marvels have facilitated access to vast quantities of information from remote locations, which has resulted in information overload. As a result, greater expertise is now needed to retrieve and analyze relevant information.

Biomedical information is an integral part of national health, education and research system. LiSc professionals have challenge to cope up the needs of their variety of users: viz. clinicians, researchers, scientists, scholars, students, decision makers and other medical as well as paramedical staff. This also includes a mechanism for collection, processing, analysis and transmission of information for organizing/operating biomedical/health information services, education and research and training. The primary objective of biomedical LiSc professionals is to provide pinpointed, reliable, relevant, up-to-date, timely and reasonably complete information to their users at local, regional, national and international level. Now everybody knows about access and use of Internet 24x7x365 in the society. Hence, question arises what is new role to be played by LiSc professionals for their survival as a knowledge manager.

LiSc professionals had played an important role and also playing a vital role and will also continue the same. However, it is now full of challenge due to variety of reasons. The various functions of biomedical communication needs are: information organization, access, education/training, motivation, persuasion, counseling, raising morals, health development, etc. to provide scientific knowledge to people about health hygiene, research and clinicians/researchers about research, education and clinical practices. Hence, challenges are to organize biomedical information in such a way that information should be accessible easily to its users. The biomedical LiSc professional mainly have to cover every aspect of family and community health education and research. However, they have to provide above services without any definite training, which is a big challenge for them. The main subjects to be covered in biomedicine are: Biology (Zoology and Botany), medicine, nutrition, public health and hygiene, family health, disease prevention and control, mental health prevention of accidents and other related to research and education. LiSc professional leaders must work as designers, stewards, and facilitators in the knowledge economy.
1.1.2. **Biomedical Information Resources, Users, and ICL, Services in India**

There is a very big group of biomedical ICLs, users, LISc professionals in India and constitutes a minor but an important part of each and every educational, R&D, business, industries falls under purview of public, private and other non-Governmental organizations. These are: Indian Council of Medical Research (ICMR) institutes, Medical/paramedical colleges/institutes, Council of Scientific and Industrial Research (CSIR), Indian Council of Agricultural Research (ICAR), Indian Institute of Technology (IITs), Indian Institute of Science (IISc), Department of Science and Technology (DST), Department of Biotechnology (DBT), various biomedical institutes/colleges under University Grant Commission (UGC), biomedical institutes/departments of Defence Research and Development Organizations (DRDO), etc. Biomedical ICLs personnel in India are becoming marginalized due to unknown reasons. The biomedical ICLs/users in India include various organizations related to higher education, research and development, medical as well as paramedical practices.

In India efforts have already been made but restricted to some bigger ICLs only viz. National Medical Library, New Delhi, National Institute of Virology (NIV), Pune, National Institute of Mental Health and Neurology (NIMHANS), Bangalore, Rajiv Gandhi University of Medical Sciences, Bangalore, AIIMSS, IITs, IIMs, Bhabha Atomic Research Centres (BARC), Tata Institute of Fundamental Research (TIFR), Mumbai, IISc, Bangalore, National Chemical Laboratory (NCL), Pune, and such many more. The resources of these ICLs are also accessible and available through various consortia based networks. LISc professionals are managing such information and library services with considerable success. It is also generally recognized that LISc professionals working in biomedical ICLs have unique performances with combination of specialized techniques, tricks, intellectual processes, managerial abilities, and ICT skills, all at a fairly high level. Their services are not only restricted to management of ICL services but have also extended to conducting short term/long term courses, users awareness programme, publishing various professional literatures, organizing/attending or supporting in organizing seminars, conferences, workshops, etc. India has its own reputation globally in field of LISc profession due to recognized contribution. The sources of information may be primary mainly journals, patents, secondary—bibliographical or full text of databases and tertiary-metadata, anytime, anywhere irrespective of form and format.

1.1.3. **Users’ Needs and Biomedical information and ICL Service (Park 2007, 2009)**

“The various and important uses of biomedical information, where biomedical LISc professionals are facing challenge are: i. To provide not only pinpointed information to measure the health status of the people but also to quantify their health problems as well as medical, paramedical health, research and educational needs. ii. To access the varieties of information from various resources available from local, national and international resources. iii. To assist in planning administration education and research at different level from different Sources of Biomedical Information are: Primary, Secondary/databases, Tertiary/metadata, which differs from user to user, time to time, place to place. For example information requirement of administrator is different than a scientists/researchers, clinicians and students.” The main components of biomedical information are: a. research, education and trainings, b. demography and vital events, c. environmental health statistics, d. health resources—4Ms, facilities, beds their utilization and non-utilizations, disease screening and epidemiology, etc.

Due to above new developments, the management of document has put many challenges to the LISc professional as either they have learnt or managed/managing through
out sourcing, this has strengthened to LISc professionals. The integration of information with biomedical research, education, clinical practices, applications, etc is an opportunity as well as challenge to them. On contrary, they have more threats but better opportunities due to various reasons. Consequently, biomedical ICLs must undergo to change their activities and services.

### 1.1.4. New Challenges (1, 23-38)

The main KM new challenges are: making high value information/knowledge, available to support decision making at the least /reasonable cost, organizational resistance, information revolution viz. Educating our users, Balancing old and new, Teaching and Learning, Education and Research, Developing just for me services, Understanding and appreciating cultural differences, Addressing issues and developing policies, Earning trust. Management and ICT skills, which were taught during 80s and early 90s in most of LISc schools as core subjects are now just as essential requirements to operate/run their systems but are now sufficient to cope new challenges. There is very tough competition between IT specialists and LISc professionals for KM. Although, both have traditionally different working style, consequently, there is an urgent need to marry for efficiency and effective KM with risk taking and vision until a new profession hybrid of above two will be arrived at. This has also led LISc professionals variety of challenges viz.; exploration of information/knowledge and revolution of ICT; proliferation in use of web resources, changing pattern of scholarly publications from print to digital as well as growing demand for digital resources. The LISc education scenario in India has been drastically changed and on the threshold of new professional nomenclature viz. information officer/scientist/technologist, knowledge manager, cybrarian and so on.

The challenges/ strength of LISc professionals at the beginning of twenty first century was to keep the pace with the knowledge and technological experiences, expertise, locating, analyzing, evaluating, collecting, collating, processing, storing and retrieving information. Consequently, the ICLs are termed as Conventional Libraries, Hybrid Libraries, Digital Libraries (DLs), E-libraries, Virtual libraries, and O-libraries. The creation and access of digital databases, awareness, use of e-resources, network and consortia based resource sharing and/or shared web tools, information without geographical boundaries, open archiving (OA), content development, discussion groups/forums, e-mail, multimedia communications, digital/virtual libraries, information literacy (IL), KM, etc are the latest development in LISc subject. This is added in the biomedical ICLs by some new concepts viz. Bioinformatics, Medical transcription, Clinical Information System (CIS), Geographical Information System (GIS), and Meteorological Information System (MIS), Psychological Information System (PsyIS), etc.

Its magnitudes are measured with bytes: KB, MB, GB and TB. These include information management: data warehouse, information exchange, commercial/open access, knowledge portals, web technology and search engines, information security, borderless/global partnership, etc. The other main issues/challenges are: declining proportionate budget (internal/external) for restructuring due to changing environment, impact of ICT, creation control and presentation of digital resources, chaos of scholarly communication, support of new users, professional values, interdisciplinary approaches, changing roles/behaviour of biomedical ICLs, users and staff, retention of skilled qualified staff, education and recruitment, etc (1-11). The progress of LISc profession and its new challenges over the years has been summarized in Table-1.

*(Based on Source: Chadha, RK: Planner-2007)

1.1.5. Challenges vs Weaknesses (1-13, 15, 21, 25-27, 38-39)

It has also been observed and reported that although there is increase in opportunities in LISc profession but there are numerous weaknesses have crept in, due to various reasons, particularly in biomedical ICLs to recognize the discrepancies between expectations and actual quality of the information service(s) provided by ICLs. Consequently, it is reasonable at this stage to find out the various weaknesses crept in LISc profession and if biomedical ICL services do not meet the users' demands up to their satisfaction. Hence, the efforts should be made to improve their services using modern IT facilities. Some of weaknesses of concerns have been explained by author earlier are (38-39): Firstly, lack of advanced IT based practical trainings at different level. Secondly, lack of convincing power, Thirdly, lack of suitable skilled manpower. Fourthly, lack of uniform/standard national policy; Fifthly, few professionals show the disinterest toward their duties and devotions; Administrative approach for not implementation of Government of India/State Government’s orders and policies and programmes and/or misinterpretation is another threat to profession; Lack of coordination among the professionals, associations, and other professional bodies, and/or restricted to individuals, Inadequate facilities/resources (money, manpower, machine and materals-4Ms) After training, lack of proper implementation of attitude, skill and knowledge (ASK) related to the new developments even for the faculty members, No power is delegated to LISc professionals in India even to take small routine case in the majority of cases, Changing users demands/expectations have become complex, interdisciplinary, increased multifold. Finally,
full text search is the first priority of users, even extended to multimedia. It is fact that in
majority of cases, we are still not very confident to cope with above problems.

1.1.6. Challenges-Threats vs. Opportunities (4-6, 12-2, 39)

The Information Age provides more opportunities, we could only dream of in the past. It
links people in ways that were not possible just a few short years ago. New technologies
allow individuals and organizations to publish information more quickly and in larger
quantities than ever before. The roles of information officers/documentalists/librarians have
changed to information/knowledge managers/specialists. Above aspects also leads to SWOT
of biomedical LISc professionals. The other benefits of ICT to develop a modern ICL are:
Digital Library initiatives, Web-based Library and Information Services, Quality Assurances,
Measurement of Customer Satisfaction, Staff users Interaction/Interface, Industrial
Interactions, Open Source Movement, Digital Presentation, Institutional Repositories, Fund
raising, Project Management, Interaction with External Environment, Out Sourcing of
Activities, E-Resources Building, Consortium, E-learning, Web presentation, coordination with
LISc Associations/professionals. These changing roles of KM have added some of the new and
modern activities in their careers with better and more opportunities. Consequently, new
philosophy is emerging. A wide variety of professional careers have been opened up in the
past decade in KM related fields and there is high demand in today's workplace for the LISc
professionals, who are able to analyze, identify and manage information needs across
increasingly diverse range and interdisciplinary approach of information environment to
come with their users needs. This is a challenge to be met by LISc professionals. The various
new opportunities have arisen along with new challenges and weaknesses are: knowledge
architect, database administrator/manager, content manager, Director, editor, manager of
technical writing, consultant, information officer, knowledge manager, gate keeper/content
developer, documentation officer, system analysts, and lately librarians are known as
cybrarians. The LISc profession has become an interdisciplinary subject and its technologies,
tricks and techniques are used everywhere to manage knowledge/information systems,
which has led to numerous new job opportunities from traditional library
organization/management to modern KM. New talents are joining LISc profession with
variety of subject backgrounds i.e. S&T, engineering, management, medicine, etc and
contributing to their myth, consequently emerging a new direction and dimension. However,
numbers of such talents are very few if not negligible in India. Some of the other new
activities of are: automated ICL services: online access using E-products/services, full text
access using Boolean and/or free text search, advance search, providing information onto
users' desk in his/her desired form format, language, irrespective of geographical location, 24
hours a day, 7 days a week and 365 days in a year, with help of ICT. This has also solved the
challenges of space, knowledge revolution, space, geographical boundaries, social barriers,
language barrier, and to extent manpower from one point of view. Consequently, hosting the
information on different sites including remote and wireless access has also given new
opportunities to LISc professionals.

1.2. Behavioural (Attitude, Skill, and Knowledge-(ASK) Challenges (39): Users and staff are
an important component of any ICL services. Information officers/librarians articulate the
need to provide appropriate services and resources to new user. Consequently, their
organization and management should be in a way to suit their users. To meet the users'
needs, it is essential to interact with users and ICL staff to know their current and selective
needs/problems. Therefore, it is essential to measure their needs and information seeking
behaviour (ASK) from time to time. As a result, such staff/users' interaction has also given LISc
professionals a new challenge-threat/opportunity to convince not only to their users/staff
but also to convince their authorities at different levels. Personal and professional behaviour i.e. ASK of LISc professionals in general and biomedicine in particular enables them to contribute effectively and positively to their users as well as professionals (SLA, 2003). Although majority of them have embraced these competencies. Workshops, conferences, short term courses, hosted at various levels by individuals, organizations, associations, etc are the main sources to address above issues. However, it is individual responsible to develop their ASK by educating themselves from time to time and continuing learning throughout the life as they claim to be professional.

1.3. Budget: With few exceptions, ICLs are experiencing slight increases in budget, which are insufficient to keep pace with costs for KM. Today, we are facing new as well as old challenges, which need more budgets due to growing demands of library resources, technologies and facilities. Consequently, we have to convince our authority, compete and some times fight for the budget. The scenario is changing from printed to digital preservation. Digital preservation requires good amount of money as new investment for documents, hardware's, software's manpower, etc. There is also a pressure on traditional ICL getting transformed into digital library partially/fully and web based resources have played a great role. A large portion of ICL budget is spend on procuring E-resources (online/offline) and their access, CD-ROM product and now online consortia based resources. (2-6, 38-39). It has also been experienced that majority of ICL's are not acquiring/possessing access to digital information through subscription but are also uniformity digital library project especially their in-house collection and grey literature.

Managing a biomedical ICL in India is no longer a matter of receiving a budget at the beginning of the fiscal year and making sure that it is not overspent. Now, ICL administrators must do long range planning to project short and long-term costs and how they will curtail the same to avoid challenges. They must make strategic decisions concerning how they will generate funding and where they will spend limited resources for staff, facilities, and collections. Now biomedical ICLs are under pressure to write grant proposals to private foundations and to government programs in order to receive outside funding to pay for specific collections or projects.

1.4. Value: LISc profession is facing a constant change in special ICLs globally and biomedical ICLs so as to it. In India, majority of biomedical ICLs' either downsized or services out sources during last few years mainly due to increasing cost, free and freely information available on the Internet, and retrieval technique are known to majority of users. Hence, it is essential to for us to demonstrate the value of our competencies, skills and knowledge, which is possible by effective management of knowledge and closely working with the project teams and specialized units within organization. To ensure good quality of information services, we have to establish and clearly communicate quality standards for accuracy and reliability

1.5. Staff: The literature shows that about one quarter of LISc professionals in biomedical ICLs in India will be retiring in the age of 60 years by 2015. However, due to lack of proper statistics, above figure of retirement cannot be quantified. In India the number of LISc professionals have been increased but there is still shortage of well qualified young professional have been reported. As there is constant change in the LISc profession, there is an urgent need to develop staff at junior level by giving them continuous trainings and education for the future leadership position. There is also trend to mange ICLs by non LISc professionals especially at top positions. It leads headache/threat for the LISc professionals.

1.6. Ethics : The scenario is changing from printed to digital preservation. Digital preservation requires good amount of money as new investment for documents, hardware's,
software’s manpower, etc. There is also a pressure on traditional ICL getting transformed into digital library partially/fully and web based resources have played a great role. A large portion of ICL budget is spent on procuring E-resources (online/offline) and their access, CD-ROM product and now online consortia based resources (2). Besides unintentional corruptions, digital contents are amenable to intentional corruption and above due to easy alter/amend/cut/copy/paste and print. Copyright and Intellectual Property Rights (IPR) Aspects: The IPR/copyrights is another aspect challenged by the LISc professionals, which needs proper attention i.e. licenses and agreements that are executed for digital/online resources. Biomedical ICLs are playing a vital role for IPR based services but are limited to developed countries and yet to be seen in India. LISc professionals advocate the need for fair scholarly communication models as copyright laws change or are reinterpreted and challenges to fair-use in a digital context continue to be made. Traditional library/publisher relationships may change substantially. Overcoming the apparent lack of commitment by the commercial information industry to future access of information will be an ongoing challenge for librarians. Public-private partnership is another concept, where we can play an important role as mediator to give better opportunities to the profession.

Due to digital preservation and retrieval problems, related to IPR and copyright have increased multifold in comparison to earlier printed media. For the long term preservation, it is essential to migrate information from old to new, from time to time. This is not possible without legal permission of omnibusal rights of owners of contents as well as software’s. Hence, there is another challenge to LISc professionals as a custodian of knowledge. Digital preservation is one of the greatest challenges for LISc professionals and has now become the mandate of the parent organization. Hence LISc professionals should be competent to meet these challenges.

1.7. **Current Trends:** It has also been reported as well as experienced that digital access has advantages over its traditional printed and/or microform collections. There are three trends have been experienced. Trend-I: Knowledge Revolution and Global Information; Trend-II: Globalization is here to stay and ICLs will play a key role in this system, Trend-III: transformation of a product. It has also been experienced that majority of ICL’s are not acquiring/possessing access to digital information through subscription but are also not possessing uniformity digital library project especially their in-house collection and grey literature. However, in case of its long term preservation digital information has disadvantages e.g. continuous flux of fast changes in technologies, obsoletion of hardware’s and software’s, short life of media, read time and default websites (Chen 2001) have put a question about the future of digital information storage and retrieval. Consequently, this has pressed challenges to the LISc professionals to overcome. There are also enough evidences to suggest that many potentially valuable digital materials have already been lost and it incurs substantial cost to recover these digital contents. (2). There is also a constant threat of backward compatibility for products viz. hardware and software change/obsoletion. The other challenges are:- i) Dynamic nature of digital contents, various forms and formats, ii) Machine dependency: Earlier information is available in tapes, floppies can not be accessed due to non availability of even drives in modern computers (Table tops/Laptops) , iii) Instability and feasibility of the media: (heat, humidity, air-born contaminants and/or faulty reading writing devices, dust. Hence unless digital content have proper preservation treatment as well as up-dation at an early stage, it is likely that it would be rendered unusable in future. iv. format and style (2). The greatest concern of digital information is its preservation due to its short life span.

1.8. **Web Presentation, Internet and Biomedical ICLs:** The tremendous increase in the biomedical information resources, especially in digital form on world wide web (WWW), has
generated a great deal of interest to LISc professionals, clinicians, students, other medical and paramedical professionals. This is also full of challenges and more as well as better opportunities to biomedical LISc professionals. Biomedical scientists, clinicians, decision makers, students, other medical and paramedical professionals face many challenges in harnessing web-based resources. Information overload, misinformation, fees, poorly designed navigation, and loss of browseability all hamper the above information searcher. In addition, many of them rely on only one or two databases and often miss unique information that is available through other sources. Biomedical librarians/information officers can team up with researchers, scientists, clinicians, etc. to develop strategies to overcome the challenges of web-based information. For example, firstly, a librarian/information officer can teach effective information seeking techniques, including how to use controlled vocabularies, how to evaluate information on the web, and how to complement web-based resources with print resources. Secondly, they can also help their users to identify multiple electronic resources to more thoroughly cover a given topic. Thirdly, in addition, they can also provide many tools and alternatives to help their users to better utilize web-based resources. Fourthly, subject directories, subject headings (MeSH), thesaurus can help scientists to cut through the information overload on the web and more quickly find relevant and high-quality information. Fifthly, database selection tools can help biomedical information users to find relevant databases for their research. Navigation of e-journal web sites can be eased or eliminated by linking software, and preprints can be more easily located using a preprint server. Finally, cost issues can be helped somewhat by making the most of the free web-based resources that are available from their organizations and other sources. Web-based resources present possibilities as well as problems. Biomedical LISc professionals can provide the strategies and tools to help scientists make the most of web-based information (13-14, 38-39).

1.9. Threats vs Challenges: During the pilot study, it was observed the declining users' reading habits, increasing computer literacy and online access, non-professionals as an officer-in-charge of ICL in India have made new treats. This has led to many unanswered questions, threat/challenges. The scattering and seepage of documents has also put more challenges in addition to information revolution and has put a pressure on ICL staff to cope with the above challenges/threats. There are treats/challenges too, due to changing needs, ASK of users as well as staffs, form and format of documents, scope of coverage, interdisciplinary nature of subjects, space, frequent changes of hardware/software-compatibility, obsoletion and social barrier/population, language problem, information revolution, decreasing manpower, changing the jobs due to better opportunities, etc.

2. Observations, Analysis and Interpretation

2.1. Firstly, the pilot study assesses real LISc current picture in India i.e. strength and opportunities and also identifies weaknesses and threats of LISc in India. The study indicates that there is also lack of uniform national policy in India for the development of LISc profession in general and biomedical ICLs in particular due to various reasons. It also indicates that the present LISc departments in India either lack infrastructure facilities or these facilities are totally inadequate and also not as per norms and standards given by UGC and professional associations. Hence, LISc professionals face challenges to educate their student for better opportunities. Study indicates that there is also insufficient provision of practical at educational level.

2.2. Secondly, it was found that there is lack of exchange of experiences/expertise among the LISc professionals groups but comparatively better in biomedical ICLs in India. There is also lack of close interaction/cooperation between LISc professionals and users, which cause
various challenges. There is also lack of coordination among the LISc professionals due to various reasons.

2.3. **Thirdly,** inadequate regular-in-service programmes and refresher courses at local, state, national level for teaching faculty and working LISc professional have been noticed. However, efforts are being made in this direction by few major LISc schools and ICLs.

2.4. **Fourthly,** lack of uniform admission policy, syllabi at national level instruction in English is another reason has been indicated in the study. There is no standard/uniform syllabus in LISc in India to cope with above challenges. The practical skills upgradation facilities to the LISc faculties to handle IT based sessions to students is also lacking in India, as course contents focuses on theories. The distant education in India in LISc has posed another challenge in quality as well number, which has misbalanced the in and out of professionals.

2.5. The study also indicates that there is lack of standard for the development of LISc profession in general and biomedical ICLs in particular in India for the better services and new opportunities in the digital era. It also points out that there are the most serious problems in policy making and implementations of various recommend useful solutions and norms to the Governments of India and other related organizations for the upliftment of LISc profession in general and biomedical ICL staffs particular.

2.6. The study reveals the administration negative attitude towards LISc professionals differently in most of the cases and needs a depth study to find solutions.

2.7. It also denotes that there is an urgent need to apply a KM technique and new quality management theory based on conventional and modern to examine the philosophy and viability of such applications.

2.8. The study points out that role of LISc professionals is changing i.e. knowledge-concepts, creation, access, applications and services to provide information/knowledge support in the process of all round development of institution/organization in particular and nation as whole in general.

2.9. There is no standard/uniform syllabus in LISc in India to cope with above challenges. It-visualizes that there are the various changes have been made from time to time but it not in uniform way, different universities are still following their own patterns but needs to be incorporated in the LISc curriculum uniformly.

2.10. It has also been observed that many new LISc professionals have commendable, significant and diverse work and working experiences however, are being discouraged by their own colleagues and professionals. Hence we have to give the value these young professionals with innovative ideas in LISc profession so as to ensure our vibrant future.

2.11. The study also reveals that there are two areas, where biomedical information officers/librarians can develop new roles in biomedical information communication are: (i) supporting scientists, students, clinicians, journalists and health communicators in selecting sources and understanding scientific papers, and (ii) directly translating scientific information into research, education, policy making items, news items, supplying a list of products in this direction (i.e. journals, patents, standards, targeted newsletters, media releases, and news items).

2.12. There is also lack of new skills, enough knowledge and positive attitude competencies in LISc profession needed to cope with the new roles to be played as biomedical information communicators.
The study also indicates that there is also no standard to evaluate LISc profession in India. At present, it is only an exposure to KM, however in course of time a standard full time LISc courses/curriculum is essential to maintain and enhance the quality of manpower the changing digital era by entering LISc schools in India and abroad.

In is very difficult differentiate threat as well as opportunities as part of LISc Challenges as where are threats there are opportunities too. The details of the findings have been summarized in Table -2

</table>
It can be concluded that there is a mixed response of all the respondents about the challenges-threats and opportunities due to digital technology. Young generation feels more opportunity, while old generation feels more threats. Both groups' remains silence in some of the cases and left the column blank. Those, who are IT skilled sees more opportunities in other discipline in addition to LISc profession, however, majority of respondents expressed that there is no escape of KM without ITs. Based on findings following interpretations have been generalized.

i. “Frequent advancement in ICT makes the task of training staff more challenging. However, the study indicates that there is lack of such expertise in working LISc professionals. All participants (100) viewed it as a major challenge i.e. both treat and opportunities. Establishing a digital library without refreshing the IT and access skills of LISc professionals is a difficult task. A breed of experts and continuous training programmes to handle and operate the latest technology in ICLs is a dire need.”

Digital library services can play an increasing role in practical and specific tasks in teaching, learning, and research. Trainings and education are the matter of concerns to LISc professionals to meet digital library challenges. It has been experienced that LISc professionals can now get informal online education regarding trends in librarianship on their desktops. They may improve their ability to retrieve information and serve users. Self learning regarding the use as well as understanding of new tools, acquisition of e-resources, and efficiency of retrieving information, dissemination, leadership qualities

ii. It also demonstrates that there is lack of awareness, understanding towards lower use of digital collections. Many studies have also found that there is lack of awareness is associated with lower use of electronic collections in scientific education and research.

iii. Lack of orienting Programmes and low level of IT literacy for users and staff to modern library services is another challenge, responded by majority of respondents.

iv. Band width/Poor connectivity has been a big challenge for accessing and downloading information especially large files. Biomedical ICLs may have limited bandwidth available. However, in India biomedical organizations are still facing with purchasing dedicated bandwidth.

v. The study indicates that besides poor and interrupted power supply, the lack of backup sources for primary information systems are commonly issues in Biomedical ICLs in India. Full use of available bandwidth is also a challenge for LISc professionals and IT personnel there. Often only a limited number of users can search at any one time.

vi. Biomedical databases- MEDline, Biosis, Science direct, Proquest, Ovid, etc are great source of electronic access in India and are very costly has put threats as well as opportunities.

vii. Biomedical ICLs in India, use of e-resources are reasonably high and satisfactory reported during the study. Increased use of resources is the result of user awareness and orientation programmes but limited to bigger ICLs only. Creating awareness and increased use is important for increased research, education; productivity, have also increased the importance of LISc professionals.

viii. Due to budgetary problems there is very poor infrastructure; it is a matter of concern that digital ICLs may lack their current resources in the future. Librarians can share in this allocation if they gain technical expertise. Collaboration and sharing of sources and services is now more feasible and practical. It is easier to share sources and services and this will enhance emerging kinds of collaboration. Here more opportunities are there but threats also can not be ruled out.
ix. Security for digital information is a demanding challenge for LISc professionals. Piracy, virus inversions, and parallel satellite networking stress are some of the problems for which solutions are needed. Information technology skills and applications are changing and developing quickly. To endure, digital libraries need the latest technology and more technical staff or experts for this purpose.

x. User satisfaction, perception, use, and usability studies regarding digital library sources will be helpful for improving digital programmes. There is lack of systematic studies in India.

xi. Library users think that the web is a substitute for the library and that there is no need of librarians/ICLs in the digital environment. It is a challenge to combat the myths about electronic resources and libraries. In fact, the librarian is a mediator between the huge sea of information and its users, and the need for a trained mediator is more apparent than ever. These confusions that web is the equivalent of a library and matter of concerned now-a-days.

xii. Study points out that there is lack of marketing of our services, which is a significant factor in the low use or awareness of electronic resources. Mostly librarians have no background in marketing and public relations and it has been experienced that marketing of LISc in India in its infancy and there is no course/paper with LISc departments on marketing.

xiii. “It also points out that a major challenge for digital libraries is complying with copyright, intellectual property rights and related issues like plagiarism. This is new and challenging field for LISc professionals and researchers. Working librarians, LISc academics, and researchers can play an important role in exploring such issues and their solutions. Creation of effective practices will be beneficial for library users, publishers, and authors.”

xiv. “There is no separate budget for marketing and promotion of e-resources and training to users as well as LISc staff. However, such provision is great opportunity for LISc professionals to learn about marketing, develop marketing plans for better promotion, develop a marketing strategy to justify subscriptions to more databases or continuing existing sources, and learn about methods for internal and external communication. Marketing research, strategic analysis, and user segmentation can help librarians know their customers and develop a user-centered approach. Customer-centered services could enhance the use of electronic databases using marketing and promotion. Because of the market demand for more orientation, the LIS Department of the University of the Punjab conducted a workshop on this topic for working librarians. Such continuing education activities can help working professionals.”

xv. In comparison to other ICLs biomedical ICLs are possessing a positive attitude towards the users. They are providing better services because of these digital sources, indicated in study. This programme not only improves the image of ICLs but also the image of LISc professionals.

xvi. It has been observed that only few ICLs are organizing Library orientation programmes for their staff as well as users mostly at the time of new enrollment/appointments/admissions, which is the practice at various biomedical ICLs in India. The role of departmental librarian is crucial. Hands-on exercises are helpful in introducing new students to electronic resources and services. Promotional material should also be distributed among all types of users. National Institute of Virology, Pune ICL conducts short term training programmes to its scientists/faculty members and
MSc-Virology and PhD students, at least twice in a year supplemented by other workshops from time to time. The short courses and workshops conducted by NIV-ICL for users and LISc professionals can be a great opportunity for librarians to improve their IT literacy.

xvii. The library web page is an effective tool and should also be used to provide tips to researchers on search strategies and effective use of resources. LIS professionals have the opportunity to learn web page design and develop other ICT skills to help users. There are some biomedical ICLs in India, who are creating and managing their home pages. The library web page is used to promote library services and especially to provide access to e-resource links.

xviii. Due to digital technology, opportunities for competent LISc professionals, the position of LISc professionals is more justified and the need to define new roles is realized with collections of both print and electronic resources.

xix. The E-document delivery service of biomedical ICLs provides better opportunity for LISc professionals to provide the better reference service to the research community and improve the image of the library, which was never earlier to this kind of service.

xx. The various ICLs have opportunities for collaboration among themselves at local, regional, national and international level for accessibility and availability of digital sources.

xxi. Downloading of all sources is not possible, unless CD-ROM subscriptions to these e-journals have been maintained along with the online subscriptions. Imaging all available sources on the main server could be a solution to this problem. This opportunity is the key to the challenge of preservation.

3. Suggestions and Recommendations

1. There is an alarming challenge for LISc profession in India. Efforts have been made to bring libraries to users on contrary earlier users used to go to libraries, however still much have to be carried out for KM. LISc professionals must work as knowledge manager, integrator, educator, working more closely to the users, applying new digital technologies in addition to LISc skills to create metadata. Hence, it is suggested that they must find ways and means to promote values, expertise, and leadership of the profession throughout the campus to ensure appreciation for the roles librarians do and can play. It is warned that if LISc schools must produce students, who are up to the demands of the changing and challenging information, market place as well as society as whole.

2. There is lack of close interaction between LISc professionals and users, hence LISc professional should also understand the organization’s culture, its aims, objectives, priorities and issues of communication. It is suggested to measure users’ needs by interaction not only with the user but also LIC staff and authority from time to time. Hence, they have to take care of issues like confidentiality/psychological barriers in KM process.

3. It is suggested that LISc syllabus have to match the changing needs of KM and users from time to time viz. changing attitude, skills, knowledge and high tolerance for rapid change of techniques and technology, continuing education program, compulsory in-service program, etc.

4. Professional bodies’ viz. Indian Association of Special Libraries and Information Centers (IASLIC), ILA MLAI, SIS, etc ICLs and senior LISc professionals should play a proactive role
to cope with share the challenges due to rapid change in LiSc due to IT-globalization, transformation, knowledge revolution.

5. It is recommended that there should be an international professionals forum to discuss SWOT of LiSc profession suggest from time to time. A special depth study is required to cover a wide range of variables to provide a uniform standard operating procedure to cope with new challenges in LiSc profession.

6. It is suggested that based on recommendations of NKC in India, UGC, MCI, CSIR, ICAR, DST, DBT and others, biomedical and paramedical organizations should take an urgent proper step to cope with the future changing needs of the users by having the intellect manpower in LiSc profession. In addition, the professional societies, academics and associations viz. MLAI, AGLIS, IIA, IASLIC, SIS and IATLISA can make efforts to bring together the professional expertise along with the academic, IT and media experts to design and develop the viable curriculum, uniform qualification for recruitment/promotional policies for various level of education to explore new role/responsibility of biomedical LiSc professionals.

7. It is suggested that all the LiSc departments should be equipped with latest IT infrastructure with modern teaching aids and LiSc professionals should also have skills to handle their routine needs.

8. This pilot study has provided a base to find out the various challenges arises however reproduction of this study, an intensive study is required to formulate legal professional policies and programmes based on additional data. It is suggested that the data of this study could be compared to other studies, and possibly aggregated with the software and services ICL data to develop operational models and optimum services that would yield the greatest productivity gain for the LiSc profession.

9. It is suggested that a national body on the pattern of National Accreditation and Assessment Committee/Courses (NAAC) to be constituted to assess the various aspects of LiSc profession from time to time.

10. Distance education in various disciplines of biomedicine and role of biomedical ICLs/LI Sc professional has to be taken seriously at different level to cope the quality and intake to balance the alarming situation has raised.

11. It is recommended that biomedical LiSc personnel must find ways to promote the values, expertise, and leadership of the profession throughout the campus to ensure appreciation for the roles librarians/information officers do and can play to emphasize information literacy instruction and the importance of the teaching role of librarians/information officers.

12. There is urgent need for the LiSc professional to educate them for use of the latest IT and share the knowledge with others to lead better changes by developing more egalitarian/cybrarian culture, the greater sharing of knowledge and information, especially biomedical information intensive organizations.

13. It has been experienced that biomedical information users' satisfaction varies by degree of pre-expectations and actual service quality. The higher the pre-expectations are, the greater the difference becomes on the service results. It is suggested that these are the important aspects to be considered, while formulating the LiSc syllabi.

14. It is recommended that we have to have regular interaction (empathy skills) with our readers by developing deeper relationship to cope their requirements Biomedical librarians/information officers can team up with researcher, scientists, clinicians, etc to
develop strategies to overcome the challenges of web-based information on the regular basis. “We need to encourage a greater diversity of prospective, become more willing to develop information strategies, and adopt the new skills, if we are to be successful in the year ahead (Abraham 2009)”

15. It is essential to improve our communication and influencing skills of LISc profession at every level. It is suggested to discuss with authority (ies) and colleagues about their expectations. Make list of skills one can contribute to your organization/team to achieve goals. Listen carefully to their needs/grievances; use skills to make proper suggestions.

16. It is suggested to market oneself in the age of competition, which is a difficult for LISc professionals but essential and need of time. The authority as well other users of your information system know that LISc professionals are a valuable resource for research, education, however they may not realize that they may also help and support them design and management of their databases, project writing, paper/report writing, find out various workers in the field, evaluation of their research (citation analysis), awards, scholarships, opportunities, marketing of products if any, patenting, publications, indexing abstracting, SDI/CAS, etc.

17. “It is recommended that we should have to accept the challenges to have the better opportunities, viz. ability to stay with touch with your valued user follow regularly with news items related to them, communicating via emails, regular meeting personally, users trainings about new services added, meeting during lunch/coffee breaks/seminars, as a member of various scientific committees, requesting to attend the meeting and even listening the conversations can also be very beneficial, strategic planning, don’t hesitate to participate in discussion related to project, relationship with key people can lead to referrals as member of network, will surely help the Library and information officer. “ Most of the people will appreciate the help /remember your offer the next time a similar situation arises.”

18. It is suggested to avoid administrative/technical scientific duties not related to his/her duties and responsibilities/boundaries by discouraging such people and redirecting him/her to better-qualified administrative staff. LISc professional are known as jack of all master of none. By nature they never say no to authority. As they are also not only good in getting work carried our effectively, efficiently and fastly but better in public relation. However, sometimes its makes them overburden and give bad names, due to embedded reasons.

19. In order to avoid a continued mockery of the library profession, it is recommended that the professional guidelines for the appointment and promotion of library staff at all levels be drafted, a standard guideline to be maintained and implemented. LISc associations have to ply a key role in this direction.

20. The criteria for scoring over other profession, it is suggested that senior library staff should be taken into consideration to draft a uniform recruitment and promotion policies to avoid various challenges. Some of these areas include: Academic and professional qualifications, Professional/ working experience, Professional activities, Research and publications, Administrative experience.

21. The LISc profession is in crisis as well as standing on a crossroad. It is experienced that there is an urgent need to find and retain its prestige, quality, which is a core issue for the future. Hence, it is suggested that the LISc staff must be professionally as well as IT trained including uses of various software and hardware applications. This is a transition period of traditional printed collection and modern research techniques to be relevant
in this information age. Consequently, any substandard service will further harm the profession. Untrained LISc professionals need courses in cataloguing and classification, management of the library and answering reference questions. Furthermore, they must receive training in searching the internet, using Boolean operators to consult full-text journals, accessing reference materials on CD-ROMs, using MARC, and compiling lists of important websites and reference CDs.

22. Refresher and orientation courses offered in India are not adequate at present as these are not very intensive and practical oriented. There is need to have more programmes for the LISc teachers to update their knowledge at different levels.

23. Finally, we have to apply our skills outside ICL settings to achieve a place in the society. It has been experienced and discussed during different platform that there are people jealously guard his/her subject areas and may be threatened by presence of library and information professional in the project/group. But one has to convince the authority about his/her ability support the project and decision making by demonstrating, where job of library and information officer begins and ends. This will require additional administrative, technical, professional and personality-based skills to find a room to advance and unexpected direction. “Working in the library, you may only get small glimpses of various projects, when people ask you for help. Working on non-librarian team, you’ll have the chance to see your company from a new perspective. You may work directly with marketing specialists, scientists, technologists, or executives. You may learn more about how your company functions or how ideas become new products, services or business models (21)”

Conclusions:

To cope with the challenges there is an urgent need to change the attitude, skill and knowledge of LISc professionals. LISc profession will not disappear, on contrary it will be an integral part of the society. However, to provide just in time information/access end user will go to other providers. It is high time to take a balanced and harmonious view hype and illusion of the Internet and web. If the LISc professionals do not grasp this shifting paradigm of service require by the users, there is possibility that ICL services will be managed by IT/management/business professionals. Hence, LISc professionals must work/endeavor as LIPs to adopt changing environment to cope the challenges. Survival of the fittest is through centuries old and also true in the present scenario for LISc profession. It is true that biomedical librarians/information officers are facing more challenges in comparison to others in the same profession.

The LISc profession now has a window of opportunity to assert the need for investment in library and information services for an information enabled “innovation” and “knowledge nation.” What is required is rediscovery of professional mission, values and commitment focused through one well-resourced association of library and information professionals and their institutions. For organizations to compete effectively in the knowledge economy they need to change their values and establish a new focus on creating and using intellectual assets to acquire new combinations of skills. In particular, they need to learn skills that allow them to find, manage, share and use information and knowledge. They need information literacy (12, 15, 21-25). Management of biomedical ICLs in the modern era characterized by a significant variety of styles and is extended, beyond the typical issues of organization and administration of human and material resources, into issues of technology, innovation and activity in shaping the components of the Information Society. So, the limits of modern Management of biomedical ICLs, includes the Management of Services, the Management of Information and the Management of Access. There is an urgent need to comprehensively review the Library and
Information Service (LIS) profession Management of ICLs the modern era characterized by a significant variety of styles and is extended, beyond the typical issues of organization and administration of human and material resources, into issues of technology, innovation and activity in shaping the components of the Information Society. So, the limits of modern Management of Libraries, includes the Management of Services, the Management of Information and the Management of Access (1-5, 17-21).

“We need to continue our journey on this revolutionary and evolutionary path toward a future learning environment. We should not wait for other entities to create solutions for our problems. Low information literacy rate among librarians and users, lack of awareness about e-resources, and inadequate promotional activities are the major challenges faced by LIS professionals. We must meet the challenges and avail ourselves of the learning and technological opportunities.”

Leadership Qualities for Digital Era Librarianship

Susmita Chakraborty
Bengal Engineering and Science University,
Shibpur, Howrah
Email: susmitachakraborty94@gmail.com

Abstract: Leadership is an important issue in all sectors wherever there is a team working together to achieve a common goal. Library is also an organization where a team of professional, semi-professional and non-professional employees strive to serve a common purpose, namely, to cater to their clientele in the best possible way. So, the leadership issue continues to hold an important niche in the management thoughts related with librarianship. With the passing of decades and centuries many things changed shapes in the arena of the Librarianship. The shift from micro to macro information, the changes in format of resources, the entrance of upcoming technologies to cause radical shift in dimensions of information storage and retrieval; and many other factors have contributed to the growth of Digital Era Librarianship. There seem to be a need of thinking proactively about the ways to combat this challenge.

This paper seeks to capture the ways of traditional leadership in our field. It also attempts to cover the new challenges that are cropping up in the recent years. Ultimately it endeavours to seek out the leadership ways that helps them to suit the need of digital librarianship.

The role of traditional librarians has been explored in details. Different factors responsible for the enactment of that role have been dissected. Those found lacking have been adjusted against the ones that are seemingly most effective to suit today’s LIS leadership scenario. It was premised that not only the copybook leadership principles, but other heuristics also go a long way to make a good leader for the digital era librarianship. Techno-savvy, skilled leaders with an aptitude of timely psycho-social interpretation of the intricacies of the challenges of the modern day librarianship are required. Only this dedicated team leaders can motivate and lead a complex band of LIS professionals.

All the aspects of digital era leadership for LIS domain came under the microscope here. The paper thus tries to present a framework to achieve better our goal and mission i.e. the ultimate user-centred LIS universe under the dynamic leadership of the digital librarian.

Keywords: Librarianship, User-centred Management, Leadership Skills, Psycho-Social Skills, Orientation and Training, LIS Leaders, LIS Domain, Libraries & Information Centres

1. Objective of the Study:

The objectives of this study are given below:

1.1 To analyze and explore the changing vision and the roles of leadership qualities for library professionals so as to meet the changes and challenges of the digital era.

1.2 To trace an outline of the evolution in the role of librarianship.

1.2 To discuss about the various skills needed for the library professionals to meet the present online and digital needs of the user.

2. The Traditional Days:

In the initial days, books were few and far between; copied by scribes, almost always backed by the royal patronage. Users were the royalty and the topmost rung of the social
layers; whereas a few very scholarly people, favoured by the affluent class might have allowed sniffing perfumes of the knowledge fragrance.

With printing, there came a fresh bridge of hope in the knowledge field with books printed in multiplied numbers and more and more people came into contact of books.

Gradually the Public Library Movement in different countries brought in the concept of ‘People's University' and the commoners were included in the privileges of enjoyment of knowledge embodied in books.

3. The Role in Traditional Librarianship

With the flourishing of the libraries as a centre of knowledge, it became evident that a librarian and his team were needed for preserving the books and later the periodicals. The establishment had become vast and the basic service of preserving books along with occasional readership had multiplied into acquisition, processing, storage, dissemination, preservation and conservation. Gradually all of those blossomed into intricate branches with many library scientists offering theoretical and practical treatises on different aspects of librarianship. All of that literature was of the same opinion on one count: all were preaching custodianship.

4. The Paradigm Shift

The new age librarianship brought out several changes, the most important being the shift from possession cum custodianship to access. There were several dramatic changes in the realm of LIS. The formats were diversified from print to digital via other non-print mediums. Some such changes are listed below:

- From possession to access
- From custodianship to facilitator
- From guardian to friend (of users)
- From reader to user
- From time-bound access to any-time-access
- From space-bound access to anywhere-access
- From librarian (or library-centred) to user-centred
- From rigidity to flexibility
- From ascetic environment to informal environment
- From specified/strict norms to Information Commons
- From strict disciplined library to relaxed pursuit of knowledge
- From one format to diversified formats
- From direction (from library staff) to participation (in the decisions)

5. From Copybook Leadership to Heuristics:

Leadership is a quality to lead a team of workers. This is one of the most important qualities in the managerial capabilities. As is always said the strength of a chain is in the point of its weakest link, the librarian as a team-leader has always the role of motivator in such a way that all his team members become capable to work (at least) adequately as per the requirements of the job in hand. In the traditional era, all the roles of staff employed at
different sections were well defined. The main consideration was monitoring the routine work and to supervise the exigencies. In the digital era, as we have seen above, many changes occurred to change this status quo. In fact, it is a time for constant change. In this transition period for being a dynamic leader, the librarian needs to consider several aspects:

- Leading from the front
- Practice before preaching
- Better among equals
- Friendly- not bossy- attitude
- The depth of subject knowledge in the area of the job-at-hand
- Awareness of the personal as well as social limitations of the staff (as well as himself)
- Assigning right person to right work
- Understanding the special aptitudes of staff
- Keeping in mind likings and disliking of staff while allocating jobs
- Remembering the invisible presence of the users while designing services and passing this attitude to co-staff
- Instituting proper orientation training for the new recruits
- Organizing regular refresher courses for the staff
- Regular ICT Workshops for staff
- Giving extra privileges to staff as a reward and recognition of good work
- Arranging invited lectures by eminent Library & Information professionals
- Allocating suitable infrastructure for every service points
- Providing ergonomic as well as aesthetic furniture for the staff

6. From custodian to facilitator

Librarianship has traversed a long journey and we have to weed out some of our older concepts while adopting quite a few new ones to suit our changing needs. The role of library leaders are now to nurture a breed of techno-savvy, skilled manpower equipped to serve a new brand of techno-savvy users. Users of digital era know a lot of things beforehand. So the library team has to go a step forward and to be aware of the quality resources available in the digital (as well as print) scenario.

7. Challenges of Digital Era

Due to its radically different nature from the traditional era, digital era provides multifarious benefits but it also offers manifold challenges. So the leadership in today's environment needs many skills and competencies in today's multi-user, multitasking online learning environment. They should have adequate technical knowledge of Operating System Software, Word Processing Software, Power Point Presentation Software, Spreadsheet, Graphics, Database Management Systems, Webpage Development and Content Management Software, CD ROM Database Searching, Networking Concepts, Digital Library Management Software, etc. Free and Open Source Software are to be used as much as possible. They should have a thorough understanding of knowledge resources (both in traditional and digital form), very adoptive towards change, pro-active, strategy-planner, flexible.
8. Towards Knowledge Economy

Physical as well as virtual space has now been utilised for library/information activities. In this changed and challenged environment, copybook leadership is no help. So, a library leader in the digital era has to be innovative, enthusiastic, and pro-active. With clarity of vision and the judicious use of the web 2.0 tools as well as heuristic knowledge, his mission is to create a user-centred library. The journey towards 'Knowledge Economy' will only be fulfilled if all stakeholders in the knowledge chain (from inception to dissemination to feedback to further creation of new/modified knowledge) take active and interactive participation in the whole process.

9. Conclusion

Whatever changes and challenges happened over the time, Creth¹ (1996) has said that the “values that are the foundation of the library profession should remain the same into the next century... values of service, quality, universal access, and co-operation”.

TQM in Library: Survive or Banish

Kuldip Chand¹, Ramesh Lal Meena² and Gurnam Singh³

¹College of Veterinary and Animal Science, Bikaner
²College of Agriculture, Bikaner
³Haryana Institute of Technology and Management, Kaithal
E-mail: kuldipavas@gmail.com

Abstract: This paper highlights the importance of TQM in libraries. It reflects that libraries are valuable to the continued survival and sustenance of the organization. This can be done best by quality management. TQM is an approach that an organization takes for improving its performance on a logical and continuous basis. The paper focuses on Principles and How to manage quality in libraries through the Key components of TQM like user-friendly approach, employee involvement and training, team work, long-term goals, flexibility, empowering people, eliminate rework etc.

Keywords: Library management; TQM; Library administration

Introduction
Recent economical correction once again proved that all those companies with strong quality system in place, providing quality products and services to the customer can sail through the hard times. TQM provides tools and the directions to improve the quality and hence mitigate the challenges successfully. TQM concept is not out of place even to the Libraries that always been committed to provide a high quality of services to its users. To improve quality means to provide right information to the right user at the right time. This further requires an approach that will be based on user requirement and user satisfaction and TQM is one of the best solutions to achieve it.

What is TQM?
TQM is ‘a system of continuous improvement employing participative management and centered on the needs of the customer’. (Juran and Bernard).

According to British standard BS 7850, TQM is defined as ‘Management philosophy and company practices that aim to harness the human and material resources of an organization in the most effective way to achieve the objective of the organizations.

It can be said TQM is a management philosophy embracing all activities through which the needs of the customer and the community and the objectives of the organization are satisfied in the most efficient and the cost effective way by maximizing the potential of all employees in the continuing drive for improvements.

Quality Management Philosophy to TQM
Pioneering works of Deming, Juran and Crosby in the field of quality management are the foundation of contemporary TQM practice. Following are the fundamental principles propounded by them on which ‘Total Quality’ concept is based even today:

- Customers are the critical factor in determining the quality goods
• People are an integral part of the process of quality management
• Needs and means of improvement in the process and product
• Management by aim and purpose towards which the system should continuously strive for
  • Use of statistical tools for measuring and identifying the scope for improvement
  • Importance of teamwork
  • Importance on continuous training of all employees
  • Emphasis on system management and knowledge management.

**Principles of TQM**

TQM is people focused management system that aims at continual increase in customer satisfaction accompanied by continually lower real cost. It is a system approach and not a separate programme. TQM stresses learning and adaptation to continual change as the keys to organizational success.

- **Customer focused approach.** This approach ensures that all are concerned with customer needs and their efforts should be directed towards winning customer satisfaction.

- **Continual improvement:** Continuous improvement should be the responsibility of everyone in the organization. The organization should not be satisfied with one time success, it should aim at sustaining success through continuous improvement because customer demands better services and products all the time.

- **Training and education:** TQM believes that people are at the core of every process and activities of the organization. Therefore, people should be trained and developed about what they are supposed to do and how it can be done?

- **Empowerment and teamwork of people:** This is to provide people with the opportunity to learn, apply and practice their skill, creativity and knowledge. The organization has to make every effort to mould the employees to work as a team.

- **Leadership:** Effective leadership is the foundation for TQM. Top management should provide the leadership for the quality awakening in the organization.

- **Measure of performance and success:** Every organization has to define what the criterion of success in their operation is and how to measure it. Timely feedback on performance through superior quality information systems is must.

- **Culture of Communication:** Effective communication is to be maintained to carry out the right jobs in the right way. The vision mission and goals should be clearly defined and communicated

- **Management by facts:** Decision must be based upon the facts for continuous improvement because if we know where we are starting from we can measure our management.

**TQM In Libraries**

The primary purpose of a library is to support the teaching, research and other academic programs of its organizations. TQM prepares the library for effectively integrating all its activities and functions in all respects, and at all levels, for total quality. Total quality refers to
means, measures and quality of the library services. Under TQM overall effectiveness of the
system should be greater than the sum of the individual outputs from the subsystems.
Therefore the set for TQM system in a library is based on system and processes which are in
synergy with each other.

User's satisfaction and continuous improvement of the services are the main two goals of
a library. By applying TQM, libraries cannot only satisfy the users consistently as per their
needs and requirements but also improve quality of their services regularly.

To achieve the quality standards, the library has to focus on the following three things:-
- The Philosophy-The library is a learning resource
- The Commitment-The commitment should be with respect to speed, accuracy,
  convenience and user friendly
- The Vision-To develop efficiency and quality of library staff by using latest
technology.

Managing Quality in Libraries

Quality Management encompasses planning, service evaluation, performance monitoring,
client satisfaction, continuous improvement and the most important the relationship and
interaction between these. We can enhance quality in library by keeping in mind the
following things:-

- **Inclination**-The first step towards implementing quality management in the library is
to have the inclination to implement it. For this a systematic and formalized
  mechanism is needed.

- **User friendly Approach**-The focus of a service oriented organization is to fulfill the
  needs of its customer; this approach helps in achieving and providing satisfaction to
  its customers. It can be done by holding need based user orientations and seminars
  in the library for its members.

- **Awareness**-It is important to be aware of current trends and be flexible in dealing
  with customer new demands

- **Enhancing the Quality of Resources**-Today, it is required to digitize the existing
  library collections, acquiring the latest IT based resources, latest equipments and
  managing and preserving it.

- **Proper Training to the Staff**- The library staff need to be trained, including skill
  training, on the job guidance and retraining. New staff should be given a thorough
  orientation. They must update their skills and expertise through participation in
  different workshops, conferences etc.

- **Empowering People**- One must trust library staff and give them responsibility and
  authority to discharge their duties well in order to generate their commitment.

- **Flexibility in Operations**- There should be flexibility in staff assignments such as job
  rotation and also there should be flexibility in changing and extending normal hours
  of operations to make it accessible to more users at their convenience.

- **Eliminate Rework**- The library work should be simplified and make sure that it is
done properly the first time. It demands accuracy, adequacy and timeliness in
performing the services.
• **Enhancing the Quality of Services**: The quality of services must meet the customers' expectations. There should be a simplified system of checkout of materials. Quick and prompt OPAC system, proper shelf guides and accurate shelving can help the users to reach to their desired material.

• **Teamwork**: Each and every member of the library staff should be dedicated towards giving quality services to its users. Since all library operations and services are linked together, all library departments should work as a team and not as an individual unit. There should be a clear vision and open minded management.

• **Getting Feedback**: Periodic feedback surveys from library users are essential in improving the quality of services. It helps in taking care of complaints and receiving suggestions.

• **Physical Layout**: The layout of the library should be continuously improved taking into account the proper display of reading material, sitting arrangement, infrastructure, ambience etc.

• **Relaxed environment**: The clean environment of the Library should encourage people to visit it regularly. Having a self serviced cafeteria with light music will break the monotony and act as a catalyst in making Library a most sought after place.

• **Publicity of New Services**: The new and alteration of services should be timely notified to the user. For this there should be speedy circulation of brochures and information kits.

• **Interdepartmental Coordination**: There should be a policy that ensures a centralized reporting amongst the various interdepartmental library advisory groups. It facilitates proper coordination and sharing of information.

• **Attitude**: The quality service of the library highly depends upon the human aspects skills of Total Quality Librarian who should be well versed with all the operations of the library, possessing good communication skills and a positive attitude.

• **Top Management Support**: Quality service in the library is only feasible if there is commitment and support of the top management at all stages of quality implementation.

**Conclusion**

TQM is a concept of management which is equally beneficial to each and every organization including service organization like library. The success of TQM will vary from library to library as each library is different. By using problem solving teams, statistical method, long term goals, employee training, user friendly approach and commitment to continuous quality improvement, the working of the library can be transformed.

The Role of LIS Professionals to Manage E-resources Through Electronic Resource Management System

Saikat Goswami¹ and Sumana Chakraborty²

¹Eastern Institute for Integrated Learning in Management (EIILM), Kolkata
E-mail : goswami0408saikat@gmail.com
²Guru Nanak Institute of Pharmaceutical Science & Technology, Kolkata
E-mail - jayee2212@gmail.com, sumana09lib@gmail.com

Abstract: The job of LIS professionals who deal with electronic resources extremely challenging: the amazing growth of electronic collections, the increasingly central role that these play in libraries, the large budgets that are involved in their acquisition, everyday's variation in the packages of publishers, interface providers, subscription agencies etc. and the frequent changes in business models and above all, the lack of automated tools to deal with the complexity of e-resource management. Electronic resource management (ERM) is the practices and software systems used by libraries to keep track of important information about electronic information resources, especially internet-based resources such as electronic journals, databases, and electronic books. An ERM system can open up new horizons related to collection management, in which information about the global marketplace and also about the institution's collection and expenditures can serve as decision-making tools for library professionals. Through the ERM system how the LIS professionals manage passwords and end-user access to online resources, track resource usage by end-users and enables charging back of costs, manages end-user access to electronic journals, stores contract / procurement information related to online resources are discussed in that article.

1 Introduction

Traditional integrated library-management systems were designed for managing print resources and are not well suited to managing electronic resources. For example, library systems typically lack the ability to describe the hierarchical nature of electronic resources: that an e-journal is part of a package, and the package is supplied by an interface provider. Nor do traditional library systems have the means to describe attributes such as license and access information; to handle the various workflows required specifically for e-resource management, such as a trial workflow; and to deal with archival rights and the restriction of access to specific locations and specific communities. Lacking such capabilities, many libraries have been looking for solutions to help them manage this new form of resource.

An ERM system should not only deal with the daily tasks related to e-resources but also provide comprehensive analyses related to a library's expenditure on electronic materials. Furthermore, an ERM system can open up new horizons related to collection management, in which information about the global marketplace and also about the institution's collection and expenditures can serve as decision-making tools for library staff.

Today's consumers are accustomed to meeting information, business, and entertainment needs instantly. Library patrons are accessing electronic holdings from their home, office, or anywhere they need information and expect an efficient user experience. These expectations...
inform the changing roles and services provided by librarians. Librarians often have direct
influence in the development and implementation of their WebPages, an autonomy that
allows for quicker progression of change. An area where we have less power to drive changes
involves our data providers. In the next few years the electronic resources librarian will need
to take an active role working with vendors to provide mobile access to their electronic
resources.

2 Objective of the Study
- To represent the features of electronic resource management;
- To find how the electronic resource management systems used in the libraries;
- To describe the electronic access resource and their types;
- To depict the challenges that Electronic Resource Management systems and LIS
  Professionals claim;
- To propose the Responsibilities of LIS professionals to manage ERM systems.

3. Importance of the study:
- The study will help to grasp the role of LIS professionals;
- This will help to the LIS professionals contribution to the development of policies and
  procedures to support efficient operations of technical services;

4. Electronic Resource Management Initiatives

As institutions realized that effective communication about their common problem of
managing electronic resources could lead to satisfying solutions they began to seek
discussion outside their own academic institutions. The “Web hub for developing
administrative metadata for electronic resource management” was constructed to facilitate
the sharing of information about institutions developing their own electronic resource
management systems (Chandler & Jewell, 2005).

The Web hub was a Web site managed by Adam Chandler and Tim Jewell (no longer
updated as of February 2005), which listed the names of the universities that were building
systems or creating initiatives to address their own electronic resource management needs.
The site also listed descriptions of the systems and contact persons at each university. The site
was built so that universities could read how other institutions were developing their tools,
and could communicate with those universities if they had similar needs.

The Web hub was a successful facilitator for those institutions that were considering
building their own electronic resource management systems but needed more information
or support before beginning their projects. The creators of the Web hub started the Digital
Library Federation's Electronic Resource Management Initiative steering group in 2001. The
purpose of the Electronic Resource Management Initiative (ERMI) was to define an essential
list of data elements that would construct a full and complete electronic resource
management system (Chang, 2003). In addition to defining the data elements, the group
sought to develop workflows and promote standards for the management of the data
(Digital Library Federation, 2006). The Web hub served as a fertile space from which the ERMI
could pull information to begin their discussions.

In the final report of the Digital Library Federation's ERMI seven functional areas required
to construct a comprehensive management system are identified: “listing and descriptive;”
license related;” “financial and purchasing;” “process and status;” “systems and technical;”
“contact and support;” and “usage” (Digital Library Federation, 2004, p. 4). By identifying these functional areas, the ERMI hopes to convey accurately to vendors or others wishing to build management systems what elements are needed (Chandler, 2004).

As the Digital Library Federation’s ERMI outlined its own goals, it also included conversations with library vendors. By communicating with the vendors, the ERMI created a successful ongoing rapport about what was needed to develop a complete electronic resource management system. By including vendors in this discussion, the ERMI could provide the data backbone of a system that could then be developed by the vendors; in this way, libraries could depend on vendors for development support and collaboration rather than acting as independent system creators.

5. Features of systems

Features of some ERM systems include:

- Supporting acquisition and management of licensed e-resources
- May be integrated into other library system modules or may be a standalone system
- May have a public interface, either separate or integrated into the OPAC
- Providing descriptions of resources at the package (database) level and relate package contents (e.g., e-journals) to the package record
- Encoding and perhaps publicly displaying licensed rights such as e-reserves, course packs, and interlibrary loan
- Tracking electronic resources from point of order through licensing and final access
- Providing information about the data providers, consortia arrangements, access platform
- Providing contact information for all content providers
- Logging problems with resources and providers
- Providing customizable e-mail alerting systems (e.g., notices to managers when actions are expected or required)
- Linking license documents to resource records

6. Electronic Access Resource and their types:

Formally two types of electronic access resources are available.

- **Direct Access Resources:**
  
  These are the resources which can be used at any time, e.g., Databases available in CD form.

  **Advantages:**
  
  - Can be used at any time and only computer is required.
  - Searching and downloading is easy and quick.

  **Disadvantages:**
  
  - Database CD can be protected from scratches or other things which may spoil it.
  - Information contained by these is getting outdated with minute span of time (not up to date regularly).
Remote Access Resources:
These are the server and client based information resources. These are the online resources in which location of the server is somewhere else, may be in another country and clients are located in different geographical location (countries), e.g. Science Online, Chemical Abstract Services (CAS), etc. This type of access can be given on specific range of IP (Internet Protocol) within the campus, access through username password in which information can be downloaded from anywhere with the help of Internet. Access through IP range, as well as username password is also there (in combined).

Advantages:
- Update is regular feature of these types of resources.
- Can be used by any number of users at a same time.

Disadvantages:
- Required Internet to use the resources.
- Processing of quarry depends on Internet speed and processing speed of the remote server. Some problems at the server can hinder information access.

Type of E-resources:
To keep bibliographical control over the published information, with the help of computer and communication technology various methods have been developed and adopted by the libraries from time to time. Broadly three types of e-resources are available to cater scholarly information needs of the users.

- Bibliographical resources: These are the resources provide bibliographical information only like: title, author, name of the journal, volume and issue number, publication date, publisher and most importantly an abstract of the entry. Bibliographic e-resources are mainly containing information on single subject. These resources are not providing full-text but facilitating the user by providing linking facility to the full-texts in some of the cases, e.g. Biological Abstracts (database covering biological sciences), MathSciNet (bibliographical database deals with mathematics), Chemical Abstract Services (biggest bibliographical resource for chemical sciences), etc. [4]

- Full-text E-resources: These e-resources provide full-text of the document apart from its bibliographical information. The approach in these databases is journal-wise or publisher-wise only, e.g. American Chemical Society is the database and containing titles published by the American Chemical Society. The same way there are, Institute of Physics, Cambridge University Press, Springer Journals, Elsevier Journals and Taylor and Francis, etc. are various publishers who are providing access to full text journals/databases through Internet.

- Portals/Aggregator products: It is just like a super market, where one can get everything from a single shop. Portals provide a single interface to search various databases, e.g. Under UGC-Infonet: E-Journals Consortium Indian universities are accessing more than 20+ different databases or products. User has to search individually (has to open all the websites one by one to search within them) for a single term if s/he wants to search in all the provided products then this exercise needs much time to cover all 20+ products. Here portals can help a user; portals will search the needed term in all the products from single interface. There is no need to
go for individual database. Portal does not have its own contents but all the contents have been taken from the member publishers and provide the linking facility to the full-text. Ingenta and J-Gate are the examples of these portals. So as the aggregator products, aggregator purchased the contents (on mutual or legal understanding) from the actual publishers and providing the access to users, e.g. EBSCO, JSTOR and ProQuest are the aggregators who are providing access to 1000+ publisher's journals from single window. Aggregators cannot provide latest issues of journals but they keep some embargo period for access. But even smaller libraries can have important journals through aggregators due to various low price subscription models.\textsuperscript{[2]}

7. Some of the challenges that Electronic Resource Management systems and LIS Professionals claim:

- **Acquisition processes** for electronic resources typically are more complex than for printed materials. They may involve trials that require supporting technology, license terms that require negotiation, and systems configuration to ensure that users have access to the material for which a license has been agreed. A single information source, such as a journal, may be available individually or as part of different packages from several different sources using potentially several different interfaces. Access to an electronic version of a serial may depend on a print subscription so the two forms of material need to be linked for acquisitions purposes, and of course budgets for print and electronic materials must be consolidated for financial control.

- Libraries may participate in **consortia** for acquiring materials, further adding a layer of complication. Some titles or collections may be purchased for the entire consortium and others simply purchased for individual libraries through a consolidated order process. Costs must be allocated to different member libraries based on a variety of possible criteria.

- Different **licensing restrictions** for different publisher, suppliers or aggregators means that detailed information must be recorded and tracked in order to control access to electronic resources. Licensing information needs to be made available to users and to a wide variety of library staff. Ideally, licensing information should be actionable, that is to say, it should be driving the process of controlling access to the electronic resource itself.

- Users in many libraries rely more and more on electronic materials, yet **resource discovery** is not simple with electronic materials. Serial titles may have records in library catalogues, but catalogues may only include print titles, not all titles to which the library has electronic access. Libraries may supplement the catalogue with separate web pages of alphabetical or topic-based lists of serial titles. Holdings information may be difficult to keep up-to-date when new issues of electronic journals appear or when the titles or coverage periods available through different bundled services of aggregators change. In most libraries, electronic journal articles can only be directly searched through external electronic resources such as abstracting and indexing services, but they may also be located using local link resolver services. Keeping all these sources up-to-date and accurate and maintaining ease of use for the end user can be a considerable challenge.

- Getting access to electronic resources requires **technology and technical support** not required for print materials. Authentication and authorisation services need to be
set-up and maintained, in many cases both for on-site and off-site use by legitimate users. This may need to be done even before titles are licensed during trial or test periods. When users cannot access an electronic resource, local trouble-shooting will be required, whether the fault is with the information vendor's system, whether it involves a local system problem or whether it involves miscommunication such as failing to renew on time or to update IP address information.

- Libraries already have complex automated systems, including integrated library systems, library portals, digital asset management systems or link resolver services. Libraries may be producing alphabetic or topic-organised lists of electronic journals from other sources. These systems need to be integrated in some measure with electronic resource management systems in order to provide users with a coherent, easy-to-understand environment and staff throughout the library with a consistent service for consulting and maintaining information.

8. Responsibilities of LIS professionals to manage ERM systems:

1. Manage the lifecycle of electronic resources from selection, subscription, licensing, renewal, access and to user support;
2. Manage a small print serials collection including subscription, issues receiving and preservation;
3. Negotiate license agreements to obtain the best possible terms and conditions, and assess vendor performance;
4. Contribute to the development of policies and procedures to support efficient operations of technical services
5. Administer use and development of Serials and Electronic Resources Management modules and linking management tools;
6. Maintain systematic record keeping, update MARC records, collect and analyze data, and prepare reports related to electronic resources and associated issues;
7. Work with Research Librarians on subscription and administration of licensed electronic resources, monitor contracts and maintain information accuracy in electronic resources management systems;
8. Work with technical services staff in Acquisitions and Cataloging & Metadata Services on procurement and bibliographic control of serials and electronic resources;
9. Work with Systems Librarian to resolve technical problems and troubleshoot access issues for electronic resources and participate in the enhancement of ILMS related modules;
10. Maintain awareness and engagement of trends and developments in e-resource acquisitions and management and transfers knowledge to staff across the library;
11. Supervise a team of para-professionals;
12. Participate in training sessions for library users

The serials/electronic resources librarian is responsible for all library continuation material in both print and electronic formats and for binding of print material. Reporting to the Associate Director for Technical Services, the librarian performs the following duties:

- Manages the serials unit of the library, establishing and documenting all necessary policies and procedures; hires, supervises, trains, and evaluates 3 support staff
Manpower Management and Development

responsible for serials check-in, serials claiming, serials check-in record maintenance, data entry related to e-resources, binding, and sorting library mail;

- Manages all required work activities for the library's growing electronic resources including creating and maintaining electronic resource records in EBSCO's ERM Essentials and updating of any related check-in and order records; maintains licensing details, preferably electronically in EBSCO's ERM Essentials, or in paper format when necessary; monitors the lifecycle of library subscriptions to all electronic resources, including individual journals, databases, e-resources packages and other electronic content;[1]

- Works with other librarians to coordinate the set up of trials for electronic resources; notifies Associate Director for Technical Services when orders resulting from trials should be placed;

- Monitors vendor performance; works with Systems/Emerging Technologies Librarian to set up and monitor usage statistics gathered through the proxy server, Serials Solutions, and/or collected directly from publishers and vendors;

- Coordinates with Systems/Emerging Technologies Librarian and Associate Director for Technical Services to troubleshoot access problems;

- Takes lead role in promoting electronic resources, working with both reference librarians and the Systems/Emerging Technologies Librarian to develop a wide array of activities that will increase the students' and faculty's awareness and use of the library's electronic resources;

- Works closely with Systems/Serials Library Specialist on claiming and replacement of print and other serials-related matters;

- Serves as a backup for placement of rush, faculty requests using a University of Pennsylvania purchasing card;

- Participates in a variety of library-wide planning activities and committees; participates in collection development activities; serves as serials liaison with other library and law school departments, library patrons, other libraries and organizations.

9. Conclusion

There is no doubt that libraries need a system to manage their electronic resources throughout the resources' life cycle. Such a system should not only deal with the daily task related to e-resources but also provide comprehensive analyses related to a library's expenditure on electronic materials. Furthermore, ERM system can open up new horizons related to collection management, in which information about the global marketplace and also about the institution's collection expenditure can serve as decision making tools for library staff.

An ERM system is basically tool for librarians, but its impact also relates to end users. The information gathered in the can serve as a starting point for users interaction with e-resources. In the near future we can expect to see the fruits of the LIS professionals work in the ways in which the various players in the information industry or in information centers build their ERM system.

Challenging Roles of Information Professionals in the New Information Environment

Ashis Kumar Pal
Indian Statistical Institute Library
203, B T Road, Kolkata-108
Email : ashispal@isical.ac.in

Abstract: In an era of information explosion and the global shift in acquiring, storing, and disseminating information in Internet era, made a substantial change in the work environment of library and information professionals. Now, Library profession is one of the most challenging professions in the knowledge society. Librarians face complex challenges posed by recent trends in Information and Communication Technology. The role of the Library professional has become more dynamic and challenging in the modern world. This paper covers the role of library and information service professionals that have undergone a large degree of change in recent years. It also outlines and discusses the professional skills and technological competencies necessary for library professionals and considers how these are acquired and developed to survive in the ever changing technological environment and to meet the future challenges.

Technology alone cannot help to bring about the required changes. Libraries will truly be benefited to the user community if the attitudes, practices, and the application of new technologies can be properly adopted by the library professionals.

Keywords: Knowledge Management, Professional Competencies, Web Environment, Information & Communication Technology, Continuing Professional Development, Digital Preservation, Internet Developer.

1. Introduction

We live in an information society where the development of information technology and telecommunication network is accompanied by a corresponding increase in knowledge with a rapid growing flow of information. This new information environment requires new skills in searching, processing and using information. In this changing scenario library is no longer a store house of knowledge, now it becomes an access facilitator without walls collection, giving access to relevant information. And, the role of the library and information professionals in this new environment has been completely changed. They plays an intermediary role to supply right information to the users at the right time.

2. Development from Traditional to Digital Libraries

With the introduction of new technologies in libraries, traditional techniques and tools have been replaced by the new ones. Most of the libraries have started providing an Online Public Access Catalogue (OPAC), access to CD-ROM, Internet and digital documents. Many of them have created their homepages on the Web form where users can have access to a variety of services from their workplaces or homes. The transition of the traditional library to digital library is well reflected in a number of digitization projects going on at the national and global levels. The libraries have started digitizing their resources and making these available over the World Wide Web and providing online services to the users.
But in spite of numerous digitization projects, electronic media by no means have completely replaced the printed material. There is still a lot of paper in our libraries and we expect this to be the case for a long time to come. The paper-less library will exist with the digital library for the foreseeable future. The situation necessitates the librarian to acquire, give access to, and safeguard carriers of knowledge and information in all forms and to provide instruction and assistance in the use of the collection to which their users have access.

3. Advent of Information Technology

The advent of Information technology and its invasion almost in all areas of LIS has added new dimensions to LIS by providing avenues to create global network of libraries, offer reference and various other services much better and faster, to open a floodgate of digital preservation and save contents of documents that were on the verge of extinction, to improve house-keeping operations, to make LIS professionals computer literate, and so on. Above all Information Technology has helped to heighten the status of LIS professionals in the eyes of the authorities. It has taken LIS a long way from a soft discipline towards a hard discipline.

4. Knowledge Management

Knowledge management is an old concept, a function traditionally performed by librarians. But, in the digital era, this term has taken on nuances that point to the need to rethink the old paradigms to reconsider who the new knowledge management players in the academy might be. According to one definition, knowledge management is the process of transforming information and intellectual assets into enduring value. It connects people with the knowledge that they need to take action, when they need it.

The prime to knowledge management is capturing the knowledge of process how organizations get their work done and of how various elements of information connect to this process. Two different types of information are necessary to accomplish this: explicit and tacit. Explicit information is packaged, easily codified, transferable, and communicable. Tacit information, on the other hand, is personal, context-specific, difficult to formalize, and hard to communicate and transfer. Combining these two types of information using formal and informal information to guide processes provides the perceived value of knowledge management. The focus is on unravelling individual know-how and applying it to explicitly driven processes so that the pinpointed knowledge is available to the exact people at the right time.

These concepts are being applied in limited and often modest scale in industrial settings. The commercial world hopes to capture the promised efficiencies of knowledge management in order to gain competitive market advantage. The knowledge management paradigm has even been referred to as the next generation approach that provides organizations with valuable, credible, and insightful information a tremendous asset and a unique advantage. Thus companies are generating databases, links to Web sites, and portals to facilitate the integration of explicit and tacit information.

The questions to be raised here are whether this change is applicable to higher education? Although academic libraries have focused quite effectively on collecting, organizing, and presenting information, the Web adds an entirely new dimension.

Knowledge management in an academic setting must encompass the community of scholars in a given discipline and must be able to integrate publications, data sets, tools for
manipulating such data, connections to databases of pictures and images, and much more. Portal technology is being used by corporations to bring together tacit and explicit information in a push technology framework. This also has potential in the academic environment because of its ability to help screen and filter information to the users.

5. Role of Library Professionals in the new Environment

In the new information environment, the librarians have to perform the role in the following areas.

5.1 Information Access Provider and Negotiator

Information professionals assume the responsibility of providing access to information in whatsoever form it is packaged i.e. audio, video, microform, numeric, computer programmes or multimedia in this new environment. They will no longer be restricted to “a single entity where everything is stored,” but rather will able to offer a range of services and collections linked together or more accessible through electronic networks. In such an environment “access to information does not always imply ownership, merely that the library has negotiated the means by which the patrons gain access to resources and information”. There is a clear shift from ownership towards providing access to electronic documents just for a given time. This in turn has created a new role for librarians that of negotiating access rights through contracts and licenses. This payment is not for the ownership of all the rights of that product, e.g. in the case of e-journals it is the publisher who decides how much access will be provided, which issues will be available and how much access will cost. Cost of e-resources has become difficult to calculate. Publishers today have come up with a large variety of new pricing strategies, e.g. ‘pay per view’ and ‘flat fees plus additional charges accounting to usage’. This means that different libraries may have to pay different prices for journal subscription. Here the librarians have to see how best they can negotiate access rights through contracts and licenses.

5.2 As an Intermediary

In a library, Professionals have been in direct contact with users seeking information. They have learnt to understand what they actually need and not what they say they need. Their services are personalised and targeted for their clientele.

When the users retrieve tens of thousands of matches from digital libraries, many realize that searching and filtering information can be complex task which should be delegated to a professional. Selecting the matches most relevant, most current and of high quality requires considerable expertise, despite continuing improvements in search refinement capabilities of digital libraries. Libraries that possess particular knowledge and expertise in knowledge transfer seem to be the most suitable candidates for this.

5.3 Organizer of Information

In the web based environment, information is rapidly growing, highly distributed with varying quality and dynamic in nature. Librarians, who have acquired a good deal of efficiency and skill in the collection, organization and retrieval of information can play an effective role in adapting these to the new environment and even to go beyond these skills and develop new ways to organize and structure information. For librarians to effectively organize and structure information available on the Internet, they require more than basic IT skills.
5.4 As a Guide

The modern day librarians must not only be proficient in the wide range of information technologies available today but they must also be able to work with teachers to adopt information literacy in their students. Information literacy is the key to life-long learning. The Librarians must teach the students how to analyse information critically and use it wisely. They must work closely with students to design, implement and revise research skills. Within the University environment undergraduate students can be seduced by the convenience of information available through the internet and the intervention of the librarian can teach the difference between intellectual access and electronic access. Librarians should teach information discrimination through personalised research assistance, guidance and instruction.

5.5 Content Developer

Content creation and development is recognized as an important activity in the digital environment. Through technically a new concept, it has been practiced by the librarians since long. The library cataloguing, abstracting and other related guides to information sources are the best examples in this context. However, the growing emphasis of this aspect in the digital environment requires some new approaches in its design and development. The librarians are expected to possess some refined skills in data organization and structuring and the presentation of the content in a helpful format so as to provide easy retrieval of required information for the users. Library professionals must become involved with the process of improving access to significant internet content.

5.6 As preserver of Digital Preservation

Digital preservation strategies are shaped by the needs and constraints of repositories with little consideration for the requirements of current and future users of digital scholarly resources. Preserving information in its different forms has been an important endeavour on the part of the librarians since time immemorial but preserving information in the digital form is posting the biggest challenge today. While printing materials can survive for centuries or even millennia without recuperation and rehabilitation, digital materials because of their fragile record that is a matter of concern for us, the authenticity and retrievability must also be guaranteed. This involves transforming digital documents to run on current media, software, hardware and operating systems by applying one or more digital preservation strategies such as technology preservation, emulation, data migration, and encapsulation. It is high time for the librarians to develop and implement proper policies and strategies to ensure long-term sustainability of and accessibility to the digital records.

6 Skills Needed to Perform the Challenging Roles

The digital library environment requires a new set of competencies for librarians. Information professionals must possess to perform their role effectively are of two kinds:-

**Technical Competencies**

- Ability to keep up with new ideas in technologies and libraries
- Ability to embrace change
- Comfort in the online medium
• Ability to troubleshoot new technologies
• Ability to easily learn new technologies

Management Skills
• Ability to evaluate the needs of all stakeholders
• Ability to question and evaluate library services
• Vision to translate traditional library services into the online medium
• Ability to sell ideas/library services

If librarians can adapt to and embrace change, they can easily learn technologies, can keep up with changes in the profession, can plan or new services and evaluate old services, can develop services that meet the needs of all stakeholders, can evaluate technologies, and can sell their ideas and market services. They will be better able to meet the challenges of changing user population and changing technologies.

Besides the technical and management competencies, the future librarian should possess learning and teaching competencies. Learning how to learn is one of the core skills of the information professional, and applying that skill through a constant process of learning both formal and informal, will be a hallmark of a professional career. Teaching or rather helping others to learn - is also an integral part of the information professional’s skill set. Helping end users to make best use of the tools which are available, developing their search skills, and above all giving them insights into how they can evaluate the quality of information are among the most important activities of the 21st century information professional. To be able to do this the information professional of the future will need to have some understanding of pedagogical theory and practice and of effective methods of teaching and learning.

For the information professional, the question must be how to unlearn and relearn how to maintain a valid role in provision of information at a time when developments in technology have brought the power of information searching to the non-specialist. The answer must be that the information professional develop additional value-added skills.

7. Conclusion
A librarian with diverse talents and training, and who is flexible, will be able to meet the challenges of future library scene. An ideal librarian is one who is competitive and assertive, who is cooperative and willing to compromise, one who is intellectually committed, who is equipped with technical and managerial competencies, who is enthusiastic to the needs of new technology at the same time not being emotionally attached to any one system.

Librarians should be ready to participate in the process of generating and distributing information and knowledge for quality of life and education for all. In short, librarians must unite to withstand the revolutions that will occur in the information and communication fields. Technology alone cannot help bring about the required changes. Attitudes, practices, and policies need to change if libraries are to truly benefit themselves and their community of users by the application of new technologies.

Development of IT Skills for Information Professionals

Aroja Ghosh and Munmun Bhattacharya
Department of Library and Information Science
University of Calcutta, Kolkata, West Bengal, India
Email: aroja.librarian@gmail.com / mun2bhattacharjee@gmail.com

Abstract: This study tells us about the necessity of practical IT training and the method of imparting of those practical IT knowledge to the information professionals in different library schools in West Bengal according to today’s job market and end-user expectation. It describes the various IT skills (both theoretical and practical) which are already implemented in LIS education and it also reveals that the information professionals are not getting hands-on training and experience in laboratory under simulated conditions or real life. This literature also provides suggestions about the various ways for improving practical IT skills in LIS education in West Bengal.

Introduction

As a result of Information explosion the libraries and information centers (LICs) have become a necessity. A continuous flow of information in all the sectors of human activity through research and innovation has brought drastic changes in the present society. At present age Knowledge and information are strategic inputs in all walks of life, along with the traditional ones of man, money and materials. Knowledge and information will continue to play a significant role in the socio-economic development. Hence there is expansion of the employment market for library and information professionals. But despite increase in the number of jobs, the total market demand for LISc professionals at present is far less than the total output. Moreover, the quality of output is not fully compatible with the requirements of the expanding job market.

Librarianship today has arrived at the information age where the role of information is increasingly emphasized as an economic resource, a marketable commodity and as a social wealth. In this context the role of librarian is very much important. He / she will have to act as a facilitator, advisor, consultant, instructor, navigator, searcher, researcher, evaluator, organizer, preserver, promoter, communicator, technical expert, as well as a manager, leader, entrepreneur and visionary. And for the success of library and information centers as effective communication system, the development of manpower to do such work is vital. One of the important aspects of manpower development in this connection is improved education system for library and information science. According to Mangla “Library and Information Science programmes should be so designed as to equip the student:

i. with knowledge and techniques to handle the immediate job requirements in an efficient manner; and

ii. to develop programmes, procedures and services on modern lines in future where the use of various modern techniques, computers etc., could provide better, quicker and efficient service.”

Skill in Information Technology (IT) can be gained only when one gets hands-on training and experience in laboratories under simulated conditions or in real life situations. The
graduates and post graduates turned out by library schools of West Bengal do not possess adequate skill and expertise to interact confidently with IT specialists, evaluate what is recommended by them and full fill their requirements.

**Necessity For Practical IT Training**

- **New Information Technology**

  Technological innovations have given rise to new ideas relating to collection, processing and dissemination of information. These innovations and ideas including Artificial Intelligence, Robotics, Speech Synthesis, Electronic mail, CD-ROM, CD Networking, Barcode systems, Electronic publishing, Hypermedia, Multimedia, Tele facsimile, Radio data paging, Networks etc. share a common technology revolving around electronics, computers, Telecommunication, Printing and Reprography, popularly known as Information Technology. Futurist Alvin Toffler has rightly predicted that computers will enhance our 'mind power' just as the industrial revolution has enhanced our 'muscle power'. At least complete practical knowledge of computer applications in LIs is essential for a LIS professional.

  LIS being an information collection, organization, and dissemination agency, technological innovations especially in the field of IT, have implications both for LIS, and the work force required to service information users and their needs. Development in educational technology and the changing pattern of education and learning also indicate challenges for the library and information community to upgrade their IT skills.

- **Revolution concept of Library**

  The LIS education aims at providing trained manpower to manage different types of libraries, information and documentation centers which, over a period of time have undergone changes in terms of needs, functions, types and range of services offered, as well as tools and techniques being used when offering the services. Application of information and communication technologies has revolutionized the whole concept of libraries, the system of information storage and retrieval and ways to access the information. Therefore, the objectives of LIS education also need to be redefined. The students need to be more practical oriented and should be equipped with intensive and extensive knowledge on the use of IT in libraries. Application of technology has opened up new vistas and thus, all LIS schools should think seriously in terms of the changing context. Students need to be given adequate knowledge of computers

**Table 1: Traditional Library concepts and modern concepts of Information Science**
Areas of practical IT skills developments in LISc curriculum

LISc courses offered by Indian library schools in different universities have become partially irrelevant since long. The debate about changing the LISc curricula has been going on for the last few years, but nothing concrete has yet been done at the national level, except for some cosmetic changes.

Dominance of Practice:

The issue of the relationship between theory and practice is not properly addressed in the Indian context. An expert once stated that we are drowning in theory at library schools and not giving enough exposure to practice. The dilemma lies in the choice between teaching students the knowledge and skills needed in their first posts to which meet the immediate needs of employers and instilling principles from which they can expand their skills and knowledge base as their career develops.

It is also seen that during the challenge of managing the complex and diverse new environment, some of the schools have been merged with different disciplines like information management and technology, information studies and mass communications. Given the pace of change in the nature of library and information services, there is still need to not only in preparing library professionals but also in establishing practitioners, a commitment to lifelong learning because the circumstances are demanding greater professional and technical awareness. As professional obsolescence becomes a real and ever present danger, only a systematic continuing education provides a method of combating such obsolescence.

In the western countries many schools have made a thorough revision and development of course programmes and also introduced new courses to meet the needs of employers in industries, and the public and private sectors. The introduction of new programmes should therefore be seen to some extent as reflecting the 'Pull-Push Effect' of recognizing the increasing need for the professional workforce to match the growth and significance of information industry and the expanding higher education system to provide the appropriate workforce.

To design a model curriculum for a dynamic inter-disciplinary subject like Library and Information Science on the national level is quite difficult, and such attempts will raise awkward questions regarding inclusion or exclusion of particular topics and the emphasis to be given to individual topics. Hence, relevant topics, which are already implemented in LIS education emphasis on both theoretical and practical aspects but the information professionals are not getting hands-on training and experience in laboratory under simulated conditions or in real life situations (i.e trouble shooting), are highlighted below-

Topics

1. An overview of modern information technologies. Development of information technologies. Computers, telecommunication, E-mail, Telex, Facsimile, Videotext and Teletext, Reprography and Micrography, Audiovisual services, CD-ROM, ADONIS, Multimedia etc.

2. Computer, media and communication technologies as applicable to libraries.

5. INTERNET. What makes up the Internet? Its applications in library and information center.

9. Electronic Mail. Introduction. E-Mail networks. E-mail services and service providers in India. Advantages of E-mail for library and information center.

13. Role of Artificial Intelligence & expert systems in library and information science work.

14. Database management system including CDS / ISIS, LIBSYS etc.

15. Methods of evaluation of an information retrieval (IR) system.

16. Economics and marketing of information products and services.

18. Information processing and organizing.

19. Operational Research.

The above topics require emphasis both on theoretical and practical aspects of LISc education as two examples are mentioned below.

**Networking:**

Node failure: In an automated library all the work station should be connected through LAN to the server, if the application is not being accessed from any of the work station then this situation is called node failure.

How to detect this problem: Using of “ping” command from run, if “request time error” is coming then there must be an issue with the connectivity.

Syntax: ping "IP address of the work station" -t

How to resolve issue:
- Make sure the computer is turn on
- Check the local area connection must be enable
- Check the Ethernet cable must be plug in
• Check other end of that Ethernet cable should be plug in into a network switch.
• Check the IP address should be in the same class compare to the server IP if DHCP server is not there.

**Database:**

Information retrieving/updating/deleting error: In a server based library, application library software will be running in which all the information will be stored into the database. Sometimes we face a problem at the time of retrieving, updating and deleting records.

How to resolve the issue:

• Make sure the database are running
• Make sure the database path is correct
• Make sure that there is no issue with the front end application
• If needed you can restore the database from database back up taken in every alternative minutes through “database attachment”

**Printing:**

Error: Printer is not working.

First needs to check the type (network/desktop shared) of printer, if it is a network printer then the following steps are

• Check printer is properly connected to the LAN switch through an Ethernet cable. RJ45 connector is working or not.
• Check Power is turned on
• Check the IP address, Subnet and default gateway of that printer by using network command in the printer's display. Also check the port details.
• Check Printer's IP is pinging or not.
• Check that is there any issue like paper jam, no paper in the tray etc.
• Make sure that work station's “printer spooler” service is running by using a command “services.msc” from run.

If the printer is shared through a Desktop, the following steps are

• Check Printer power is turned on
• Check the respective desktop is running
• Check the cable attached in between of the desktop and printer, that cable is properly inserted
• Check the printer is properly shared through “my network place” with proper name
• Check that is there any issue like paper jam, no paper in the tray etc.
• Make sure that work station’s “printer spooler” service is running by using a command “services.msc” from run.

Therefore, it is right time to inject some practical IT training with proper resources i.e Library Open Source Software, Database, Servers and Network equipments etc. and fine tune the LIS courses accordingly. It will make the LIS courses consistent with the Job market.
Conclusion & Suggestion

Our curricula must be overhauled drastically if we want to retain our identity in a rapidly developing information society. A good number of posts of LISc professionals are already in the catch hold of technological experts. Along with the development of LISc curricula the faculty should also be developed. The existing faculty members should be trained to cope up with the new requirements of LISc Schools.

Thus, the education and training programmes in Library and Information Science must make a provision to prepare the professionals to assume the pro-active role in coping with new technology and the information explosion. In brief the designed course contents should concentrate in developing IT knowledge, skills and tools corresponding to the four basic identified areas creation, collection, communication and consolidation. It is hoped that this approach will serve as a guideline to the future curriculum designing activities in the developing countries.

The followings are some suggestions for improving practical IT skills in LIS education in India:

- LIS schools/departments may be provided with IT laboratories fully equipped with the latest hardware and software including Internet connectivity, networking and library management software.
- Syllabus should be revised from time to time with the advent of the information technology changes.
- The syllabi in the LIS departments should view the developments taking place in information technology, information resources, information access and their impact on libraries and library profession.
- All the present librarians, who completed their LIS education ten years before, should be provided with computer/information technology training through these new LIS schools or through some refresher courses.
- There is a need for strong networking of libraries for resource sharing
- More practical orientation courses and refresher courses should be conducted for the LIS professionals and teachers.
- The LIS students may have training in libraries, which should have IT environment for gaining practical experience.
- There is a great necessity of funds for the acquisition of new technology in order to enhance the services in the library.
- There is no uniformity among the digital library course content offered by university departments and institutions in India. Eight of 18 offer the course as a unit or part of a unit of the Information and Communication Technology Paper following the recommendations of UGC Model Curriculum (2001) to a level of 90-100%. The other 10 university LIS syllabi on digital libraries vary significantly. Indeed, the recommendations of the UGC Model Curriculum are outdated with regard to present technological developments and needs revision.

Use of Information in Scientific Research: A Case Study

Mala Aditya
Research Scholar, DLIS, Jadavpur University, Kolkata-700032
mala_s_aditya@yahoo.co.in

Abstract: This paper throws light on the use of various information resources by the scientists, working in Central Mechanical Engineering Research Institute (CMERI), Durgapur, in their research. Through citation analysis of the research publications published by the scientists, several aspects of their information use have been revealed in terms of the amount of scientific productivity in a particular period of time, type of authorship, mostly used sources of information and their up to datedness etc. Data for three consecutive years have been analyzed to find and compare the information use pattern of CMERI scientists.

Keywords: Information use, Scientists, Central Mechanical Engineering Research Institute (CMERI)

1. Introduction

Information plays a vital role in scientific research because an effective research is always in need of a support of information. Scientists are the diverse group of professionals displaying professional commitment to and attachment with their research. They need specific information at the time of research and in some cases they collect it in advance foreseeing its usefulness in research. Besides, scientists always have to keep themselves informed about the current advances in their fields of interest as well as in the peripheral areas of their subject to keep pace with the development in that field. As research outputs in the form of scientific literature are causing the information explosion it becomes very difficult for the scientists to locate and retrieve the exact piece of information from a huge unorganized world of information. Therefore, to provide them the right information at the right time, information professional (act as an information intermediary) need to know scientists' actual and potential needs. Citation analysis can be a good method for evaluating their information usage. This method entails the analysis of bibliographical references that are usually appended to the articles of a journal.

Central Mechanical Engineering Research Institute (CMERI)

Central Mechanical Engineering Research Institute (CMERI), Durgapur is the apex R&D institute for mechanical engineering under the aegis of Council of Scientific and Industrial Research (CSIR). It was established in February 1958 with the specific task of development of

5. http://www.cmeri.res.in
mechanical engineering technology. Being the only national level research institute in this field, CMERI's mandate is to serve industry and develop mechanical engineering technology so that India's dependence on foreign collaboration is substantially reduced in strategic and economy sectors.

CMERI is greatly indebted to the works of scientists and researchers for their work in their respective field for the soaring graph of its achievements. CMERI library is equipped with modern technology, have expert information professionals and above all a rich collection of information sources (both in print or non-print version) on mechanical engineering and allied areas. It has a well furnished air-conditioned reading hall and an Electronic Library too. This laboratory also has a developed networking system and access to CSIR e-journal consortia. In this paper an attempt is being made to study information use pattern of scientists through the citation analysis of their scientific publication.

2. Objectives:

The specific objectives of this study are:

1. To find out output of scientific research publications of CMERI scientists over the years.
2. To find out pattern of authorship in their research publication.
3. To identify different types of information resources used by them for their research and the special inclination towards any particular type of information resource.
4. To prepare a list of top ten journals those were mostly referred by the scientists.
5. To find out the age of the information used.

3. Methodology:

The present study applies citation analysis technique to the bibliographic references cited in the 67 research articles published by the scientists, working in CMERI, Durgapur, during the year 2007-2009. Data were collected by searching “SCOPUS” database. It was verified by the annual report of the institution for the specific years. Citation analysis was done by studying the numerical distribution of citations across the bibliometric variables taken up for this study. Duplicate references to a citation were considered as one. The collected data was tabulated and analysed for the purpose of discussion.

4. Scope:

The present study is confined within Central Mechanical Engineering Institute (CMERI), Durgapur. Sample consists of about 67 research articles, published by the scientists working there, from 2007 to 2009. About 1200 references cited in the articles were analysed for the study.

5. Limitations:

The new extension of the institute at Ludhiana was not considered here. Preliminary data regarding the publication is mainly based on the Scopus database and hence any error in the database will be reflected here. The time period is limited from 2007 to 2009, which may not provide the complete trend of information use of scientists.

6. Data Analysis and Interpretation:

6.1 Chronological distribution of the articles:

Total 67 articles were published by the scientists on their research work during the period
of study i.e. from 2007 to 2009. The result shows an increased tendency in research publication. In the year 2009 there was a rapid growth in publication which was an indication of more research activities in that year (Table 1 & Fig. 1).

**Table 1:** Chronological distribution of articles

<td>34</td>
<td>50.75%</td>
</tr>
<tr>
<td><strong>Grand Total</strong></td>
<td><strong>67</strong></td>
<td><strong>100.00%</strong></td>
</tr>
</tbody>
</table>

6.2 Type of authorship:

While examining the publications by the scientists it is seen that most of the articles are written either by three authors or more than three authors. It brings out clearly the prevalence of team research in CMERI. It also indicates towards sharing of the same information among scientists. This collaborative approach is an important feature of scientists’ information use pattern (Table 2 & Fig. 2).

**Table 2:** Type of Authorship (Cumulative)

6.3 Frequency distribution of forms of cited literature: The references given at the end of each article i.e., the cited literature were analysed and the different information sources used were identified. The result reveals that scientists frequently use journals for information followed by books and conference proceedings. It is also observed that manual, technical report, lecture notes, theses are also being used in the research.

6.4 Rank list of journals according to citations:

All the information sources used in the reference articles were scanned and the counted to get that how many times they were cited in the research publications of the scientists. The top ten most important journals were identified which got maximum citations from the scientists.

While comparing the data obtained for different years it is seen that few journals i.e., Inorganic Chemistry, Journal of the American Chemical Society and Journal of Molecular Catalysis A: Chemical are used frequently by the scientists in all the years.

#### 6.5 Time lag between articles published by the scientists and references cited by the scientists:

Year of publication of references cited in the articles were subtracted from the year of publication of the articles published by the scientists. It revealed that scientists preferred to use recent information (i.e. not older than 5 years) in comparison to very old information. From the table below it is clear that the use of very recent information was less. The possible reason may be unavailability of documents at the publishers end.

7. Conclusion

This has been observed from the study that the research publications of scientists working in CMERI, Durgapur have been increased over the years. It indicates towards the growth of research and increasing need of information. Collaborative approach in research and sharing of same information among scientists has been found from the study of authorship pattern. Team research or part research is supposed to be the reason behind it. From citation analysis of those research publications it is revealed that scientists make use of various resources as per their need. However they heavily rely and use journals for authentic and up-to-date information. Recent and new information is highly required by the scientists. There are few journals, mainly published from outside India, are commonly and frequently used and cited by them. Result shows that in most of the years books occupy the second position according to its usage followed by the conference proceedings. The findings of the study will be useful to the librarians and information officers of CMERI as well as to other scientific institutions and research organizations. It will be very helpful for them to acquire more useful periodicals and other information sources according to the need of the scientists within the limited budget.

Collection Management
Acquisition of Electronic Resources: Dealing with Licensing Issues

R. Prabakaran and B.T. Kurahatti
Scientific Information Resource Centre
Tata Institute of Fundamental Research, Mumbai 400005
E-mail: praba@tifr.res.in; kurati@tifr.res.in

Abstract: Presently, the libraries are adding more and more resources in digital form. As compared to print resources, the electronic resources pose different set of challenges to libraries. One such challenge is to ensure perpetual access to the digital information held remotely at the publisher's end. A standard way to ensure this is to enter into a license agreement with the publisher, whereby the rights of the end-users are protected. This is, however not an easy task. The terms and conditions mentioned in the agreement are generally in favour of the publisher and the librarians need a lot of persuasive skills to alter the terms and conditions to serve the interests of their organisation. This paper discusses some contentious issues that may arise while negotiating the terms of the license agreement.

Sub theme: Collection Management: Electronic Resource Management

Introduction

The electronic publishing has a very short history, compared to traditional form of publishing. The first known form of e-publishing is in the early 1980s when plain text e-mails were sent to the subscriber via a mailing list. But, the subsequent technological advancements made a tremendous impact on the information cycle process of creation, gathering / production and dissemination of information, which in turn hugely influenced the electronic publishing itself. In 1994-95 the first e-journal was published and the distribution of e-journal turned out to be an instant success. Majority of the journals are now made available in digital form. The publishers are now offering package subscription to electronic journals at highly reduced price as the publishing charges of e-journals have substantially come down, as compared to their print counterpart, which involved huge cost of printing and distribution. Subsequently, even bibliographic resources were brought in electronic form. Soon, e-books also made their presence. These developments made the libraries to seriously rethink their collection development and information delivery policies. While moving totally to electronic may be a distant possibility, a progressive shift from print to electronic, is being noticed.

Moving from Print to Electronic: a critical issue

While the print and online versions have their own advantages and disadvantages, a discussion on this is beyond the scope of this paper. However, to put the subject in perspective, some critical remarks are made here. Print resources subscribed / bought are physically available in the libraries and form an asset. Online resources subscribed / bought on one-time purchase can only be accessed by users, as the digital content is held remotely at the publishers' end. This raises the issue of ownership vs. access and is a well debated point in the user and the librarians' communities. The fact, however, is that, in case of online resources, the libraries are currently dependent totally on publishers to access the subscribed
bought content. This situation made the libraries to think in terms of ensuring perpetual access to the subscribed/bought content. Of course, publishers too have their own concerns of protecting their content from misuse. It is, therefore, a mutual interest of both the publisher and the end-user to enter into an Agreement protecting each other’s interests. This agreement is generally known as License Agreement.

License Agreement and its Types

A License agreement is a legal document and contract between the publisher and the institutional library. Both the parties agree to abide by the terms and conditions set in the agreement. There are basically three different kinds of site license agreements according to - 1. the type of library, 2. product/model, and 3. number of sites. The agreements by the type of libraries include Academic/Research, Government/Corporate & Public and generally the variations are in terms of users, fees, etc.; The agreements by product/model are based on the e-resources, such as E-journals (including archives), E-books and Bibliographic Databases. The agreements by site(s) are applicable according to the number of sites, such as single site (single geographical location), multi-sites (multiple locations headquarters and branches) and consortium (member institutions).

Although, there exist some Standard Licensing models (http://www.licensingmodels.org/), each publisher has his own Agreement and a close look at these indicate that there is a lack of consistency and standardisation. A few publishers have put up the copy of their site license agreement on their website (example, MIT Press, Royal Society Publishing and Nature Publishing Group), but others do not do so maintaining it as confidential document. However, signing of License Agreement has almost become mandatory. In fact, a well known publisher has a policy which stipulates that they will raise the invoice for an e-product only after the library signs the agreement. In a way, it is good that the library will know all the terms & conditions before buying the product. Other publishers send the agreement after the purchase order is raised and the payment is made. In such cases, it may be difficult to negotiate any changes in the clauses.

The terms and conditions of the site license agreement are heavily tilted in favour of publishers. However, except a few, the clauses in the Agreement are generally subject to negotiations. The job of dealing with such issues would be much simpler for those Organisations which have a Legal Cell. It is advisable to refer the document to that Cell. But, as is generally observed, many Organisations do not have such Units which make it imperative for the Librarian to take up himself the responsibility of examining the legal aspects in the Agreement. In that case, the librarian needs to be very cautious in studying various clauses in the Agreement. He/she must ensure that the interests of his/her Organisation are protected to the maximum possible extent. After going through the Agreements carefully, one has to first seek clarifications from the publishers on those points which do not seem to be very clear. Possible changes may be suggested to bring in more clarity. If certain terms are unacceptable, it is essential to request for changes/amendments in the Agreement. Sometimes, it needs a hard bargaining and the librarians need to have strong negotiating skills. Discussed below are some of the critical issues on which negotiations may be required.

Key issues in the Agreement

1. Perpetual Access : Perpetual access is ensured by most of the publishers. But some publishers put a condition that the library should subscribe to at least one online journal or any online product of theirs. Otherwise, they will charge maintenance fee/hosting fee. If the access is provided off-line, then they ask the libraries to bear the cost of production to provide the content on other electronic media, such as CDs/DVDs, for local hosting. Some
publishers prefer to use the term 'Continued Access' in place of 'Perpetual Access'. The terminological difference may have to be clearly understood. As one UK publisher puts it - the 'Perpetual Access' in their terminology refers to a limited period and the 'Continued Access' means indefinite period. Libraries need to ensure that their parent institution will not be put to disadvantage and take precautions to get inserted right terminology. However, some publishers do not provide perpetual access at all to the subscribed content. If an online subscription is not renewed, the libraries will lose access even to the paid content. If that is the case, then the Licensing document must clearly state it. In such cases, the libraries need to think seriously about an alternative method of archiving either by continuing with print version or get archival year-end CDs / DVDs, as offered by some publishers.

II Withdrawal of Content: Publishers insert a clause that it reserves right to withdraw the content, which it no longer retains the right to publish or infringes copyright or defamatory, etc. While the last condition should be acceptable, the first two conditions may sometime put librarians in a fix. These situations may arise when a journal title is transferred to some other publisher. The new publisher may not permit the old subscribers to access this content, free. It is all the more critical if this content is substantial and / or directly relevant to their users. As a remedial measure, one can demand insertion of the following clauses - The publisher will make best efforts to convince the new publisher to provide access to the old subscribers or shall allow local hosting of such content. Also, if the withdrawal is substantial (generally more than 10%), then the publisher shall refund the amount proportionately.

III Restrictions on Usage: Generally, publishers do not permit users to download entire journal issues and e-books. A standard condition to this effect may be found in License Agreement of all the publishers. There are publishers who even put a restriction on the number of pages and chapters printable from e-books. The decision of the libraries to buy e-books from such publishers depends on how comfortable they are with the restrictions imposed by the publishers. A few publishers do permit the licensee to make an electronic copy and a hardcopy for backup purpose. However, the libraries need to create necessary infrastructure to preserve the content on their local computer server.

IV Access to Archives through Third Party: In the event of a publisher deciding to wind up his operations or merge with another publisher, it is an obligation on the part of the publisher to make alternative arrangements to provide access to archive of the licensed materials concerned. This is where the third party arrangement comes into picture. Many publishers have made arrangements with some external agencies for the long time preservation of their digital archive. Some examples are LOCKSS (Lots of Copies Keep Stuff Safe), CLOCKSS (Controlled LOCKSS), PORTICO (a digital preservation service of ITHAKA), and National Library of Netherlands. In a trigger event, it becomes the responsibility of these agencies to grant access to the content to the subscribers. The libraries should insist publishers to incorporate in the agreement a clause specifying the names of the agencies with whom the arrangements are made to provide access to the content in the event of publisher closing his business. Some of these agencies offer paid service, but since the subscribers have already paid for the content earlier, it becomes a debatable point whether the libraries can afford to pay again for the same content.

V Inter-Library Loan (ILL): Providing a copy of an article to another library (not-for-profit, non-commercial) under ILL is generally permitted by most of the publishers, but with varying conditions. While the publishers expect subscribers to observe normal Copyright rules, some put specific restrictions on document delivery system. While one publisher permits only to send copies in print format, the other allows electronic transmission through secure network, but insists that the recipient library delete the file after printing a paper copy.
Such clauses are non-negotiable and the libraries need to accept them, so long some form of ILL is permitted.

VI Governing Laws: Business of digital content is only three decade old. Like any other business, there is a possibility that disputes might arise especially in terms of copyright rules, access problems etc. If such disputes remain unresolved mutually, the aggrieved parties have no option, but to approach Judiciary. This gives rise to the problem of jurisdiction as the two parties belong to different countries. The agreement is generally governed by the laws of the country of origin of the publisher. However, some publishers are flexible on this issue. While some agree to sort out the issue in the court of subscriber's country, others agree to the condition that the aggrieved party can approach their respective countries. Alternatively, some publishers also allow for an independent arbitrator mutually acceptable to both parties.

VII Fees: Fees charged by the publishers for e-books, online journal packages, etc. varies from library to library, depending upon size of the user community. However, publishers also offer price cap in case a library agrees to go for a multi-year agreement. The base price and the price cap shall form part of the Agreement and as such need to be stated explicitly.

VIII Counter-signed copy: Original copy of the agreement is generally in duplicate and the two signed copies are exchanged between the library and the publisher. However, the Agreements of some publishers have only the acceptance column which needs to be signed by the Library. In such a case, libraries should keep with them one copy of the agreement.

IX General Conditions: Some publishers incorporate a clause in the agreement, stating that the content of the Licensed Material is 'subject to change without notice'. If accepted, this allows the publisher to alter the subscribed / purchased content without notice. In this case, subscriber will be totally in dark about the changes effected, including withdrawal of any content. To avoid this, the librarians need to insist for change in the clause appropriately by changing it to 'subject to change with prior notice to the licensee' (i.e. library). This will protect the end-user from any loss of content, as the user will have time to copy and store the content locally. Some publishers also incorporate a clause that the contents of the License Agreement should not be disclosed to a third party without their consent. While the publishers urging to maintain secrecy is understandable, it may be difficult for libraries to accept such a clause, especially for those organisations funded by State / Central Governments, which, according to the Right to Information Act, may have to be disclose the content to those, who seek it. Therefore, it is essential that appropriate changes are demanded in the clauses.

There are some publishers who would not like to make any changes in the body of the Agreement claiming that it is a Global Agreement and changes cannot be incorporated. In such a situation the libraries can demand to include specific changes needed in the Agreement as a separate appendix which can be termed as 'Specific Covenants'. This may be acceptable to some publishers.

Conclusion

The electronic resources, with convenience of browsing the content, have also brought in a lot of other problems. Ensuring permanent and uninterrupted access, dealing with usage restrictions, etc. are a few critical issues. While dealing with these issues, Librarians, using their negotiation skills, may have to do tough bargaining and must ensure that the interests of their Organisations are protected to the possible extent. The License Agreement System that is currently in practice may itself undergo a change and eventually get standardised. Until then, librarians will be on a sticky wicket. The issues discussed above are by no means
exhaustive, but only indicative of a few critical issues that the authors themselves have come across while dealing with Licensing issues.

**References**

Abstract: The collection development policy for knowledge Resource Centre can be made by applying various value added analysis. This study primarily focuses on the current usage of information resources at National Metallurgical Laboratory through citation analysis of research papers. The output of the study set forth a collection development tool for applying in acquisition policy. The escalating price of library materials and multiple demands of users required a judicious selection policy for subscriptions of library materials keeping in mind the current usage of the library holdings. The Bibliometrics method has been applied to 187 research papers contributed by CSIR-NML scientists during 2010. A total of 3825 references used in research papers has been individually scanned, tabulated, analyzed, and interpreted for drawing conclusions on usage of collections. The findings depict that more than 82% references were used from journals and rest 18% references occurred in books, proceedings, manuals, monograph, Reports, Patents, Bulletins, Standards, Meetings, and Technical Notes. These references range from 1950-2010. The maximum literature referred covered the period 2001-2010 and a total 1915 citations fall in this range. It was observed that 918 references used were in electronic format, which are mainly added through subscription and CSIR-e-journal consortia. It is interesting to note that, a total of 3154 (print + electronic) references scattered over 545 journals, out of which 180 journals are alone emanating from Elsevier, providing 1731 references. Altogether 35 R&D areas were identified, covering 545 journals, ranging from Earth Science to Waste Management and Utilization and Biomaterials to Nanotechnology. However, Metallurgy and Materials Science area has been extensively quoted in 1176 (37.76%) of the total 3154 references, covering 147 journals. This study further traced out the core journals with the help of Bradford curve and suggests top 20 core journals as per the current needs.

Key words: Usage pattern, Collection Development, Electronic Resources, R&D Libraries, Bradford's Law

Introduction

The aim and objective of any Information Centre is to provide pinpoint, exhaustive, and nascent information to readers who use information for a variety of purposes. A library, therefore, is always adjudged good or bad on by its usage. This goal makes the collection development evaluation imminent. Considering the importance of such usage, an attempt has been made in this study to evaluate the current usage of literature at CSIR-National Metallurgical Laboratory, Jamshedpur, Jharkhand (Erstwhile Bihar). The worth of a library collection can be judged through various methods like, circulation of documents, user survey, download analysis of literature, Citation/Reference analysis, etc. The present study, however, evaluates the library usage through reference analysis. Today, citation and ranking information are becoming key aspects of knowledge management in R&D Knowledge Resource Centers. It helps to examine the changing user needs and products so as to...
understand and manage the information resources besides responding the user needs better.

Effective collection analysis and assessment provides quantitative and qualitative data for evaluating the usefulness and utility of a library's holdings. It assists with determining budget requirements by focusing attention on how well the library's collections in specific areas support the needs of the users and the institution as well. It also points out whether the institution's investment in the collection is being managed responsibly. The aim of such assessment is, therefore, to determine as to how well the collection supports the goals, needs, and mission of the library or parent organization. The collection (both locally held and remotely accessed materials) is assessed in the local context. Evaluation seeks to examine or describe collections either in their own terms or in relation to other collections and checking mechanisms, such as lists. Both evaluation and assessment provide a better understanding of the collection and the user community.

The major problem of research libraries all over the world today is deciding as to which serials should be subscribed to meet the needs of their specialized users without subscribing to any unnecessary journals. The problem has been further aggravated recently by shortages of funds and subsequent cuts in library book budgets. In order to operate effectively, libraries must identify literature of high utility to their clients, and must acquire and organize the literature in such a way to ensure their optimal use.

One of the generally accepted methods of scientific investigation is, indeed, to follow the scientific literature by the simplest means. Various sources are used by scientists to gather information, for example, through regular reading of all available texts, recommendations of colleagues and superiors, and references or citations in other related publications.

**Literature Surveyed**

The citation analysis technique can be traced by using references found in scholarly works. In the early 1970s, Coale evaluated the Latin American colonial history collection at Chicago's Newberry library using bibliographies of a group of scholarly monographs (Lancaster, 1993). These bibliographies were also checked against the holdings of other libraries for comparison. In addition to scholarly works as the source for compiling checklists as noted in studies by Olaosun (1984), Bland (1980) and Stelk and Lancaster (1990), recommended readings and textbooks were also used. Citations drawn from student's dissertations or term papers was another source of checklist used in numerous studies, the earliest being that of Emerson's analysis of 23 engineering doctoral dissertations at the Columbia University between 1950 and 1954 (Heidenwolf, 1994) to determine the percentage of references held or not held by the other campus libraries in the university. Sylvia (1998) analyses the serial titles cited by the psychology students in their research bibliographies to evaluate the use of a journals collection for the purpose of journal selection or de-selection. In another study using doctoral dissertations, Buzzard and New (1983) investigated library collections used by doctoral students in the humanities, sciences, and social sciences. However, the use of this method is determining the percentage held; collection usage, because of the possible links between physical accessibility and use or citation of an item, is questionable. Moreover, materials consulted for background knowledge may be under represented while the patrons may not necessarily use sources that were cited. Nevertheless, it is a valid method of evaluation as shown by Nisonger's test of the Lopez method conducted at the University of Manitoba (Nisonger, 1980) and his test of two citations checking techniques in which citations were drawn from journal articles. Being inspired by earlier studies, an attempt has been made to determine the usage pattern of the information resource of CSIR-NML by way of case study.
Purpose of the study

The purpose of the study was to analyze the usage of resources of knowledge resource centre by R&D personnel at National Metallurgical Laboratory, Jamshedpur by citation analysis of research papers contributed by CSIR-NML during 2010 and to suggest the core journals in the field of Metallurgy and Materials Sciences through citation analysis applying Bradford curve.

To be able to show an example of the contribution of KRC to Paper publications, the following specific questions were addressed:

1. How extensively are the references of research papers published in 2010 are available in the collection of the Knowledge Resource Centre?
2. How old references being used in research papers?
3. Which Metallurgy and Materials Science journals are most frequently cited?
4. What is the “core journal” percentage for a Metallurgy and Materials Science?
5. What is the narrow subject area of journals used in NML research papers?
6. What are the highly used publishers of journals?

Limitations of the study

Keeping the time constraints, the present study has the following limitations. First, the sample used in this study is quite limited as only 187 research papers appended with 3825 citations were included in data. However, many previous studies were based on citation analysis of dissertations, individual journals, publications from government body to trace out the usage of library holdings and suggested core journal in specific subject area, but the present study focus on the usage and collection development of research library catering to the needs of Metallurgy & Materials Sciences.

Research method and data

A total of 187 Research papers published in various formats like, SCI, Non-SCI, National proceedings, International proceedings and book chapters were identified by institutional affiliation. Fig.1 depicts the status of R&D publications, a maximum of 120 papers appeared in SCI was downloaded from Web of Science with complete reference data and the remaining 54 papers were scanned form Non-SCI journals, proceedings and book chapters.

Thus, the total number of references cited in the 187 research papers was 3,825. The average number of references per paper was 20. The availability of references was coded under the following four categories:

1. available in electronic form;
2. available in print form;
3. available in the open network; and
4. Not available.

The bibliographic references in each article in the sample were first examined by classifying each citation into one of the following nine source categories by format of publications: books/monographs (includes chapters in a book, monograph series, sourcebook), journals (i.e. scholarly and academic serials in the form of print or online, articles “in press” with journal title cited), periodicals (i.e. magazines, newspapers, working papers, Newsletters), conferences proceedings (proceedings, seminars meetings, workshops, forums),
unpublished (i.e. unpublished manuscripts, thesis/dissertation, documents, reports/documents, unpublished test and short communications), reference sources (i.e. government documents, dictionaries, handbooks, encyclopedias) reports (i.e. published reports by institutions or corporations), web documents (documents retrieved from the internet via the worldwide web with Uniform Resource Locator (URL) provided, and others (i.e. articles in journals but without journal title cited or any other format without main source mentioned). “Conference proceedings” was designated for compilations of papers presented at conferences or symposia that were not published as a regular issue of a journal.

Results/discussion

The individual research papers scanned and references of all 187 papers contributed by NML scientists and technical personnel are analyzed and found that, more than 70% titles were within the library collection. It was observed that the consortia based journals were used optimally during 2000-2010. However, other electronic resources like web of science, metal abstract and newly added commercial digital library emanating from American Society for Testing of Materials have also made their presence in references of the respective research papers.

Research Papers Published in 2010

During 2010, NML has contributed 187 research papers, appeared in various formats. About 70% papers were communicated in journals, in which SCI covered 64.17%, where as Non-SCI recorded 5.34%. A total of 49 papers (29.41%) were published in different Proceedings (10 in National and 45 International) and only two papers appeared as book chapters. Figure 1 highlights the overall status of papers that has been considered as sample to determine the latest usage pattern of information resources at NML knowledge resource centre. The reference/citation appended with 187 papers were further analyses and interpreted under various parameters.

Format of Reference

A total of 3825 references extracted through research papers are further classified according to the format and presented in Table 1 for required analysis and interpretation. It is interesting to note that, 3154 (82.45%) references were used from journals, available in print and on-line. While the print version comprises 58.45%, the electronic version recorded 24% only. It was further observed that, a wide variety of formats has been consulted and referred.
in research papers such as book 318 (8.31%) - most of them are reference books, proceedings 176 (4.60%), reports 62 (1.62%) including project reports. The remaining formats like patents, standards, thesis, bulletins, monographs, manuals, meetings, and technical notes collectively could constitute only 3% of the total.

Time span of Reference

The usage of collection according to time span reflects the value of old documents of different periods. A total of 3825 references appended with 187 research papers were classified in seven standards time slot of ten years as per the format used in research articles. The resultant data were further charted for analysis and interpretation. The findings reflect that, a maximum of 1915 references fall in the period of 2001-2010, which indicates that the latest literature has been frequently in demand by the scientists and technical personnel of the laboratory. During this periods, knowledge resource centre were linked with CSIR E-journal consortia, hence 918 journals of electronic version has been referred in their respective research papers.
Age of references

In order to develop the library collections, it is important to examine the publication dates of the references. If older literature has not been used, transferring to a repository library, for example, is worth considering. The research papers in our data cited relatively are from current sources (table-2). More than half (50 per cent) of all citations were from works published between 2001-2010, and (30 per cent) were published in 1991-2000. Nineteen per cent of the sources were published during 1990 to 1950. According to this study; NML research papers cited more than 80 percent articles from last two decades only. However, old literature covering the period from 1950 to 60 also currently being in use by R&D fraternity but not as current one. The NML research papers have an extensive background for which old documents were also referred in research findings.

Figure 3 Ages of References
Application of Bradford Curve

Among the several statistical expressions, Bradford’s Law of Scattering is perhaps the most popular and the best known of the entire bibliographic concept, which aims to describe the effective working of sciences by mathematical means. The law describes a quantitative relation between journals. Table 3 depicts analysis of journals based on figure 4 that illustrates the Bradford-Zipf plot— the cumulative number of papers for each journal.

*CJ* = 545 Total number of journals referred in NML papers

& & 7RQDOH]PHUHPHQWV\$HURPHQWVDWLRQVXHG

$YHUDJHFLWDWLRQSHUMRXUQDO

**Table -3 Identification of Core Journals**
against the logarithm of its rank for journals cited NML publications. The figure clearly demonstrates approximately the S-shape as the typical Bradford-Zipf plot, though the initial rise is somewhat faster than the typical one. The approximately linear portion appears often, the journal rank of about 16. The top 16 may be considered as the core journals that have been cited in NML research papers.

**Identification of core journals**

Journals are supposed to be the fastest and nascent source of research findings. Most of the R&D organizations laid emphasis on journals collection. In our findings, more than 82% references cited from high qualities of journals are listed in JCR list. Out of 545 titles, more than 60% titles were used from library holdings, 30% titles are taken from inter library loan through J-Gate, inter library loan, CSIR e-journal consortia, exchange of in-house publications and the remaining 20% are cited from open sources and personal sources. It is interesting to observe that, 38.58 references met from 20 titles and are available in library holdings.

**R&D Areas of Journals**

Since Metallurgy and Materials Science is a cluster of various subjects' areas, it is essential for collection developers to know the usage pattern according to narrow subject. To some extent, it also helps in identification of trends and mapping of metallurgy and materials sciences. The findings show that, 82% of the total references were from journals, which fall in 35 subjects as highlighted in table-5 for further analysis and interpretation.

**Analysis and Interpretation**

R&D area of 545 journals has been determined by UDC scheme under 35 categories, which were further narrowed down into 11 broad categories as shown in table 5 and figure 5 respectively. According to the findings of this study, the maximum 147 (26.97%) journals fall in the area of Metallurgy & Materials Science, which used a total of 1176 (37%) citations, whereas Chemical Technology area covered 74 journals (13.74%) includes 351 (11.12%) citations. Biomaterial subject cover 41 (7.52%) journals carried 172 (5.45%) citations. The areas of journals reflect the core subject area. Such findings would certainly be helpful in

Subject areas of Journals are arranged, according to alphabetical order followed by UDC code.
decision making for acquisition of journals according to the current needs of the users of NML Knowledge Resource Centre.

Publisher wise distributions of citations

Publisher plays a key role in development of library collection. There are no geographic barriers in marketing of information resources & ICT work as catalysts to increase fast retrieval of on-line resources. The publications from Elsevier, Springer on-line journals were highly used in references, which correspond to 180 Journals (33.02%) and 49 Journals (8.99%) respectively. Open resource journals constitute (28 Journals) only 5.13% of the total and as such not highly significant. Table -6 and figure 6 and 6.1 can be referred to for further understanding of the facts.

NML knowledge resource centre has recently added ASTM standards and digital library in their collection. It is an unique source of data, information, and knowledge that include standards, special technical publications, monographs, and journals. This study reflects that all most all form of learning resources appeared in references of research papers, which altogether constitute 35 citations.

*Others includes Society, Institutions, Organizations’ in house publications
Conclusions

Research & Development organizations are the core and optimal consumers as well as generators of research papers. In this study, the authors made their sincere efforts to unmask a concrete example of how this works in practice, and to find out the occurrence of library collections in the references of research papers. The authors scrutinized the papers contributed by NML in 2010 for collecting reference data. The total number of references cited in the 187 research papers was 3,825. The average number of references per paper was
20. More than half (50 per cent) of all citations were from works published during 2001-2010, followed by 30 per cent citations were published between 1991-2000. Nineteen per cent of the sources were published during 1990 to 1950. According to this study, NML research papers cited more than 80 percent articles from last two decades only. However, old literature comprises from 1950 to 1960 also currently being in use by R&D fraternity, but not as current one. The NML research papers have an extensive background for which a considerable number of old documents have also been referred in their research findings. Since the existing practice of R&D organizations require latest information pertaining to basic research, applied research and industrial research, more than 82% of the total resources have been consumed from primary source (58% print + 24% electronic). It is, therefore, interesting to note that 35 subject areas have been identified for 545 journals. It aptly shows the current mapping of metallurgy and materials science tailored to the present needs. The Bradford-Zipf curve further applied for 545 journals and finally identified 16 core journals for adaptation in acquisition policy of the parent resource centre. Library collections are built on results from previous research. They provide new researchers with a good foundation for creating new knowledge and to expand their research. Therefore, by looking at works cited in current research papers, one can acquire a fair picture of the sources, what kind and how old they are, that new research in these fields is based on.

Such information is highly significant particularly when libraries develop their collections. In addition to the acquisition of new literature, development of the collection, this also includes the elimination of, obsolete and rarely used literature. Simultaneously, the collection in use must also be restored in repository library where the material is still available for various purposes such as historical research.

Acknowledgement

The first author Dr. P.N. Mishra would like to paid tribute to his father Late Prof. B.P. Mishra, Ex Director and University Librarian, University of Patna, Bihar for learning and followed Library & Information Science profession through valuable guidance. The authors are also grateful to Dr. S. Srikanth, Director, CSIR-National Metallurgical Laboratory, Jamshedpur for his encouragement to take up such attempt.

ABSTRACT: With the rapid development in the field of science and technology, the world is now moving into an information era. Mainly focused on the Internet, computers and telecommunication, digital and multimedia technology displays a whole new world to the people who use these technologies. The building of the information highway will change the entire society's methods of production and ways of studying and living. People who already realised that the library is one of the most important components of a nation's basic facilities, which must have an information system that develops towards networking and electronic processes and will therefore require some breakthroughs in terms of the time and the space and the width and depth of information service. At the present, most developed countries have already built many digital libraries and library networks of different sizes. The networking of the library plays a vital role in terms of promoting the sharing of access to information. In this way library networking will become the new model and the direction for the development of the library consortia. Now a day mostly publishers are looking to sell through library consortia due to simplify the sales process, to increase their market penetration, communication with core libraries, and increase the speed of sales. However, all consortia are not organized in the same way, for that publishers work with different consortia in different ways. Some publishers insist on payment of an excess charge over and above the print subscription cost to access electronic versions, whereas some provide the electronic version freely and charge only for the print. Many publishers permit free access to a few years of back files but will offer perpetual access rights for all files which fall within the subscription period. It is accepted that there will be significant savings on the charges depending on the number of libraries in the consortia and their print base of subscriptions. Also access to a large portion of fresh contents may be accessed by paying a nominal extra charge, without dropping any existing print subscriptions. Thus, publishers are slowly maturing from a "print plus" model to an "electronic plus" model. This paper discusses the concept, need, factors, advantages and disadvantages of library consortia, also discusses the formation of CSIR consortia with various issues in India and suggests a new model of library consortia in which all government autonomous research organizations could participate which include "electronic plus" model for the purpose of subscription.

Keywords: Consortia, Networking, Council of Scientific and Industrial Research, New Delhi, CSIR Consortia

Introduction

The word consortium has been derived from Latin, meaning association or partnership. In general a Consortium could be described as a group of organizations who come together to fulfil a common objective that usefully requires co-operation and the sharing of resources, and need to have a clear mutual goal in order to ensure their success. Various definitions are there in different dictionaries on consortium but almost the meaning is same in the context of library. An e-journal consortium means the collaborative acquisition of access rights to electronic databases and journals and the aim of is to achieve what the members of the group cannot achieve individually.
Journals play a major role in the R&D but unfortunately the number and cost of journals are increasing at very high speed. Number of journals and their costs has increased by three-folds every 15 years and 226 per cent, respectively. During the last 20 years in terms of dollars, this may be further compounded by currency conversion whereas the increase in library budget was only 110 per cent during the same period. In another study by the Association of Research Libraries in USA, it was found that average CPI (Consumer Price Index) for US increased by 73 per cent during 1986-2004, but the research libraries expenditure for journals increased by 273 per cent during the same period due to the increase in number of research scholars, institutions and global competition. The estimated number of STM (Science, Technology and Medicine) journals is about 25,000. Out of this 15,000 journals are peer-reviewed and 12,000 are in e-form.

All types of libraries/information centres are not in a position to subscribe all the information resources required by their users. Not even a single library can meet the thrust of knowledge required by all the readers from its stock of information to the full extent. To solve this, libraries have started library cooperation, i.e. inter-library loan (ILL), resource sharing, and library consortium, etc. For the past four centuries, dissemination of information was done through print media alone, but now the electronic media has taken over this mean of communication. Basic purpose of the consortia is sharing of resources, money, and manpower. In the digital context, it is the access to information rather than holding information. 'Collection building' concept has changed to 'Connection building' with the help of Information and Communication technologies (ICT). Access to the e-resources and the subscription amount is shared among the participating libraries. Significant price reduction can be achieved through consortium and individual libraries in the consortium will have collaborative acquisition of access rights to databases and e-journals. Library consortia's have become powerful negotiating parties and incorporating their own clauses in the contracts with the publishers and just no longer signing the standard contract texts provided by the publishers.

Types of Consortia

The types of consortia identified are generally based on various models evolved in India in Variety of forms depending upon participations' affiliation and funding sources.

i) **Open Consortia** - This type of consortia is very flexible and it is the wish of members of consortia can join and leave any they please. INDEST Consortium is an example to this.

ii) **Closed Group Consortia** - This kind of consortia emerges either by affiliation and collaboration among them like CSIR, DAE, IIM Consortium. The formation and operation of the consortia guidelines and its administration are fairly simple and easy.

iii) **Centrally Funded Model** - In this model, consortium will solely depend on the parent body. A few examples are CSIR, INDEST, UGC-INFONET and ICMR Consortia, etc.

iv) **Shared-budget Model** - In this model the participating libraries take the lead and form the consortium. IIM and FORSA are examples of this model.

v) **Publisher Initiatives** - The Emerald Full-Text Library published by the Emerald Publishing Group (formerly MCB University Press) is recent example. Here, the consortium members will get deep discount price to the participating libraries.

vi) **National Consortium** - This is a model perceived at national level which includes member libraries from one country.
Benefits of Consortium

Some of the important advantages of the proposed library consortium are as follows:

- Main advantage of e-journal consortium is, it checks the space problem, shelving, binding, lending, and related aspects of member libraries.
- Instead of user coming to the library, the library is available at the user's desktop/laptop virtually all the time (24/7). Available 24 hours a day, 7 days a week.
- It saves the time of the user since instant access will be available after every updating unlike the shipping time, missing issues, and mutilations, etc., which prevail in respect of print media.
- Consortium builds communication among different libraries and avoids duplication of core journals.
- Consortium provides high quality literature and faster document delivery service, i.e., it provides a wealth of relevant resources readily available and helps in facing the challenges to have a meaningful presence in this digital era to its users.
- It is easy to assess the areas of interest of users so that efficient services can be provided by the concerned librarians through usage statistics given by the publisher.
- The consortium have been offered better terms of licenses for use, archival access and preservation of subscribed electronic resources, which would not have been possible for any single institution and facilities to build up digital libraries.
- Helpful to provide better library services like CAS and SDI.

Bottlenecks of Consortium

- Absence of a printed copy of Journals and lack of archiving and back files availability.
- Require training of staffs in handling electronic documents etc.
- A consortium requires high initial investments in licensees and infrastructure, internet connectivity, and other accessories.
- Copyright problems. Problems like copyright / excess downloads from the publisher.
- Content provider/publisher combines both essential and non-essential journals as a package. Whereas in print collection, the selection is done by subject expert(s) and only journals of core area are subscribed. Therefore, measures have to be taken to avoid unwanted items and recall the most relevant items.

Growth of Consortia in India

The new technology or the modern information technology has made the task of resource sharing very simple and convenient. The new technology brings forward to the information field many products and services which have changed the nature of fundamental library objectives and operations. Over the last 2 decades, the libraries have witnessed the impact of information technology that has been affecting the structure of the services to a great extent. Library networks have grown mostly during the last 30 years in different geographical environment in order to cater the specific needs of the users. In the U.S. there has been a proliferation of them. In the developed countries, resource sharing networking was started long back, e.g. the growth of the network in the U.S. can be traced from mid 1960. USA is the birthplace of library networking and by now libraries in each state are networked to local, regional and national network. On the other hand, the growth of
library networks in India can be traced to the initiatives made by NISSAT in establishing CALIBNET in 1986 and DELNET in 1988 and other networks like UGC/INFLIBNET has established UGC-INFONET Consortium, Digital Library in Engineering Science and Technology (INDEST) Consortium of all Indian institute of Technologies (IITs), Indian Institute of Science (IISc) and a few other institutions which include RECs, NITs, IIMs, etc., the Forum for Resource Sharing in Astronomy and Astrophysics (FORSI) is a consortium of Raman Research Institute (RRI), Indian Institute of Astrophysics (IIA), Tata Institute of Fundamental Research (TIFR), Inter-university Centre for Astronomy and Astrophysics (IUCAA), National Centre for Radio Astrophysics (NCRA), and Physical Research Laboratory (PRL) subsequently.

**CSIR consortium**

The Council of Scientific and Industrial Research (CSIR), a public-funded organisation, is India's largest R&D organisation established in 1942 with a chain of 37 National laboratories and institutes. CSIR is carrying out the research work in various disciplines all over the country.

**CSIR Organization Structure**

```
Department of Science & Technology
  ↓
Department of Space

Department of Ocean Development & Earth Sciences
  ↓
Central Govt. S & T Departments

Department of Scientific & Industrial Research
  ↑
Council of Scientific & Industrial Research

Department of Atomic Energy
  ←
Department of Biotechnology
```

**Need for the Consortium** - There has been a constant decrease (~66 per cent) in the journals base of CSIR laboratories over the last decade, which necessitated its libraries to find out alternate solution to make available R&D information. While laboratory size, areas of work and number of researchers vary, it is desirable to have comparable and adequate information resources irrespective of the size or strength of the laboratory.

**Objectives of the Consortium**

- The primary objective of the overall program focuses on enhancing the visibility and impact of CSIR research output internationally in terms of papers and patents.
This will be attempted by providing access to maximum possible e-resources to the researchers.

To provide CSIR & S&T staff electronic access to global knowledge with continues to subscribe existing e-resources.

To expand the information base of CSIR and provide divergent nature of contents of information to CSIR users subscribe to additional e-resources.

E-Journal Consortium

The Director General set up a study group in April 2001 to collect/study and compile information to the journals subscribed by the CSIR labs. After several deliberations the e-journal Consortium project finally took shape as a Network Project of CSIR under 10th Five Year Plan with a budget layout of Rs11.79 crores for the plan period 2002-2007 targeting to access 4500 e-journals. E-journal consortium is being coordinated centrally by CSIR's National Institute of Science Communication and Information Resources (NISCAIR) as nodal agency for implementing the Consortium, with a task force team established with senior scientists from CSIR laboratories and also negotiation committees to negotiate and finalise the agreements with the publishers in providing required e-journals, databases, etc for CSIR's constituent laboratories. The heads of the libraries of the participating labs are designated as the nodal officers to implement the Consortium access to e-journals at their respective labs. CSIR e-Journal Consortium strengthens its library resources by pooling, sharing and providing electronic access services like e-journals and international databases to its scholars and scientists. On 10 June 2002, CSIR signed an agreement with M/s Elsevier Science to access around 1500 world class e-journals. NISCAIR has coordinated well by constituting different committees like Core Committee, Negotiating Committees, etc., for effective implementation of the consortium. “Electronic plus" price model was chosen to maintain the print collection of the individual institution libraries irrespective of the duplicate and triplicate subscriptions from the same publisher and paying an extra amount of 9 per cent of the print to ScienceDirect at the beginning of the project. This extra amount is varied subsequently in the following years based on effective negotiations by the concerned committees. Usage statistics is being provided by the publisher to the individual institutes for effective monitoring of the consortium. Archival issues pertaining to past five years are also being provided by the concerned publisher as per the agreement. E-Journals and other document requirements of the constituent laboratories have been put forth by the nodal officers to coordinating agencies. The coordinating agency prepares the financial document and gets the money from CSIR negotiation committees to allocate this money to different publishers based on the suggestions received from the nodal officers. In this way it receives more than 4000 e-journals. CSIR Consortium has proved to be a great success and its impact can be measured in terms of revenue savings, usage of e-journals in terms of downloads and contribution of articles in international journals, etc. Substantial revenue has been saved, and significant growth in number of papers and IF (Impact Factor) have been achieved. Quantitative as well as qualitative improvements have been achieved in the years following the access to e-journals through the Consortium. Continual and steep increase in the number of downloads has also been recorded. In this way CSIR became a leading institutions of the world and the contribution of CSIR researchers in international journals have raised. The National savings on this account is around Rs. ~535 crores. Upgrading the CSIR information system is proving effective in meeting its researcher's divergent nature of information requirements.
Elsevier Context

To fill the lack of information in the CSIR laboratories, decided to subscribe e-journals of Elsevier by individual laboratories and sharing these resources among the CSIR laboratories. The coordinating agencies suggested subscribing only the unique journals and avoiding for the duplication for maximum possible so that sharing of e-journals shall be easier through the CSIR network. As scientific literature is exploding, publishing has become an increasingly profitable enterprise. The competition in the publishing world is very fast, with even old scientific societies turning to commercial publishers, to bring a degree of professionalism of producing and marketing their journals. As journals multiply and costs increase, libraries must worry about budgets and coverage. Problems are compounded by growing costs of maintaining both print and online subscriptions and issues related to continuing electronic access to back files. Large publishing houses like Elsevier Science and Springer-Verlag are beginning to monopolise the world of science journals, which arises a situation that promotes a seller's market. CSIR Consortium did not agreed to the price hike proposed by publisher and termed it as unreasonable and gave a counter proposal for consideration of the publisher. However, access to ScienceDirect was stopped in April 2008 as the agreement was not renewed between the CSIR Consortium and the publisher due to failure of negotiations with the regard to price hike by the publisher. In this way after 2008 CSIR laboratories were felt the necessity for a strong networking among their constituent laboratories.

Subscription to JCCC@VIC: J-Gate Custom Content for Consortia

After this CSIR entering into JCCC for exchange of holdings of individual CSIR laboratories on inter library loan basis but problems with JCCC are it is a platform which is common to all for accessing information which becomes a great problem to serve the users. As CSIR laboratories are scientific in nature so their members are also dealing with scientific field, but it is difficult to analyze the member of JCCC. It becomes a question mark in their authenticity in identification.

NAL Context

For possible solution NAL (National Aeronautics Limited) compile a union catalogue for CSIR laboratories and it has come forward flood the updated union catalogue with the cooperation from the member CSIR libraries, an alternatives mode to avoid JCCC.

Experience network with DST

After seeing the experience of CSIR consortium with the publishers, DST (Department of Science and Technology) has also decided to join with CSIR consortium for their e-journal subscription.

National Knowledge Resource consortium final solution

Open Consortium- Consortium of S&T institutions, will help to expand the information base will strengthen the negotiating power, develop uniformity across different departments. NISCAIR should perform a leading role to bring other S&T organizations under Consortium. CSIR going to interconnected all the scientific laboratories with powerful computer networks with one CSIR slogans and the solution is formation of National Consortium of Scientific Departments and named as National Knowledge Resource Consortium (NKRC).
**Conclusion**

From the above discussion it is felt that there must be some efforts made by the researchers and librarians in reducing the library budget, and carefully use the money for subscribing core journals so that maximum number of the user's needs can be satisfied. Bundled packages and big deals from the publishers may be avoided and those journals which satisfy the highest degree of user needs may only be subscribed. Formation of a National Consortium and collective and logical negotiation with the publishers may be another alternative that can be suggested. The consortium, with its collective strength of participating institutions, has attracted highly discounted rates of subscription with most favourable terms of agreement. Consortia are tools, which will aid in exploiting the features of the e-journals as well as in effecting savings.

E-mail: subirmilis@gmail.com

Abstract: It appears that whole gamut of marine science information is ever growing in many dimensions as a result of increased R&D activities in different areas of Oceanography, which in turn calls for building information infrastructure to support marine science study and research for our national development. Institutional Digital Repository (IDR) plays a very important role in storing, organizing and disseminating information. In this respect, IDR of Cochin University of Science and technology (CUSAT) are significantly contributing towards digitization of earlier collections. ‘Dyuthi’ of CUSAT has been playing an important role in making a collection of articles, theses, and learning objects etc. to the world free of cost. The paper unearths the present scenario of marine science information resources as well as the latest situation of the collection development part of ‘Dyuthi’. The study furnishes detailed information of various resources available in IDR of ‘Marine Science’ in India and provides an overview of the activities of ‘Dyuthi’.

Keywords: Open Source, Institutional Digital Repository, Marine Science, Cochin University of Science & Technology, Dyuthi, CUSAT, Institutional Repository.

1. Introduction

Oceanography, also called Oceanology or Marine Science, is the branch of Earth Sciences that studies the earth’s oceans and seas. It covers a wide range of topics, including marine organisms and ecosystem dynamics; ocean currents, waves, and geophysical fluid dynamics; plate tectonics and the geology of the sea floor; fluxes of various chemical substances and physical properties within the ocean and across its boundaries. Recognizing the importance of the ocean, the marine environment and its resources for life on earth and for sustainable development, the United Nations has declared 1998 as the ‘International Year of the Ocean’. Oceanographic information (OI) is multidisciplinary in nature and covers all areas of coastal and oceanic environment. OI is not limited in one field and may include various fields like physical, chemical, biological, geological, morphological, meteorological oceanography and so on. It appears that whole gamut of oceanographic information is ever growing in many dimensions as a result of increased R&D activities in different areas of Oceanography. This situation, in turn calls for building the information infrastructure to support the oceanographic study and research for our national development. In this respect, institutional digital repositories (IDR) play prime role in digitizing, preserving, organizing and disseminating oceanographic information to the users at any time with least cost and high speed.

2. Objectives

The prime objective of the paper is to identify the component ideas associated with the subject Oceanography and to find out various information resources. The present study is
confined to the identification of Indian repositories listed in open DOAR. The specific objectives are:

- To unearth the marine science research scenario of Indian sub continent;
- To find out different oceanographic information resources on marine science available in India;
- To critically study different digital objects of IDR in relation with marine science and the method of disseminating oceanographic information to its users;
- To study Dyuthi, the digital repositories of Cochin University of Science & Technology (CUSAT).

3. Review of Literature

Institutional repositories first appeared in 2002 as an institutional response to the increasing trend for scholars to post their research online, usually on their homepages but also in subject based repositories. Repositories are associated with a number of different scholarly initiatives and there is a large body of literature that describes IRs and explores their role within scholarly communication and publishing. The Scholarly Electronic Publishing Bibliography contains over 200 entries on the section Repositories, E-Prints and OAI, whilst the Open Access Bibliography also contains over 200 entries in the Institutional Archives and Repositories subsection. The following section will provide an overview of the main drivers behind the creation of institutional repositories, examine the current literature on institutional repositories and how the term will be used within this work.

4. Marine Science research Indian scenario

India has a very long maritime history. The peninsula is surrounded by the Arabian Sea, Bay of Bengal and Indian Ocean. The vast coastline is 7,516.5 kilometers. Its territory includes 1256 islands. The area of Exclusive Economic Zone (EEZ) of the country is 2.02 million square kilometer covering an area extended up to 200 nautical miles from the shoreline. The vast coastal and offshore environments support a wide variety of marine ecosystem, rich in species diversity and economic development activities. A good number of government departments, research institutes, societies, associations and universities are actively engaged in the R&D activities in the diversified areas of Oceanography and their numbers are increasing day by day. Good numbers of institutes in other subject fields are also showing deep interest in the area of Oceanography. Because of the inter-disciplinary nature of the subject and ever increasing amount of information generated on it, the users require exact and precise data and information. Since independence during the last sixty years, a reasonably good number of institutes, scattered all over India, are engaged in oceanographic study and research. The study has identified sixty six numbers of institutes with their associated centres engaged in oceanographic study and research in India. They are categorized as core R&D organizations (19 in numbers), non-core R&D organizations (5 in numbers), government departments (19 in numbers), academic institutions (20 in numbers) and non-government organizations (3 in numbers). Exchange of information amongst these institutions helps in bettering the expected output and in reducing the duplication of research efforts.

5. Marine Science resources- Indian scenario

Oceanographic activities throughout the world have led to the development of several international agencies and programmes. In addition to UNESCO, agencies like, Intergovernmental Oceanographic Commission (IOC), European Centre for Information on
Marine Science and Technology (EurOcean), International Council for the Exploration of the Sea (ICES), the International Council for Science (ICSU), the World Meteorological Organization (WMO), Joint WMO-IOC Technical Commission for Oceanography and Marine Meteorology (JCOMM) and many more have contributed greatly to the generation and dissemination of oceanographic information. All these efforts have developed some notable global oceanographic information programmes, namely, International Oceanographic Data and Information Exchange (IODE), Global Climate Observing System (GCOS), Global Environment Monitoring System (GEMS), Global Ocean Observing System (GOOS), Integrated Taxonomic Information System (ITIS), Ocean Biogeographic Information System (OBIS) and so on.

One of the important objectives of the Science and Technology Policy enunciated by the Government of India is “to ensure, in an era in which information is key to the development of science and technology, that all efforts are made to have high speed access to information, both in quality and quantity, at affordable cost; and also to create digitized, valid and usable content of Indian origin.” The Ocean Policy also calls for the establishment of a centralized data system with appropriate mechanism for collection, collation and dissemination of ocean related information both from indigenous and foreign sources. The growth of Oceanography depends on two factors: the talent of the marine scientists to collect, process and analyze their own data and to the extent to which they have access to data and information collected by other scientists in other laboratories both at home and abroad.

In realizing the importance of oceanographic information as well as to fulfill the objectives of the ocean policy and to provide information support to potential users, the Ministry of Earth Sciences (MoES), erstwhile, Department of Ocean Development (DOD), Government of India has launched the programme of Ocean Observation and Information Services (OOIS). The OOIS programme comprises of different information services and systems for the benefit of the user community. Though these programmes have been launched and operated separately with specific objectives, in some cases, they are interlinked with each other so as to share the data and information pertaining to oceanography. Besides, different information sources, institutional digital repositories (IDR) are playing a vital role in storing, digitizing and disseminating oceanographic information in the form of journal articles, books, book chapters, conference proceedings, patents, thesis and dissertations and various other information resources and their demands are increasing day by day with the increased population of repositories available on the web.

6. Institutional Digital Repositories (IDR) in India

An institutional repository (IR) is a set of services offered by an institution to manage and make accessible scholarly digital materials created by the institution and its community members. An IDR is the digital collection of an institute's intellectual output as well as valuable resources. It provides web based mechanism for faculty members, scientists and researchers to publish and access their research publications. Repositories are important tools for preserving an organization's legacy; they facilitate digital preservation and scholarly communication. At present, there are 60 IDR in India on various disciplines as per DOAR. There is no uniformity on the contents of these repositories. Some repositories contain single item, while some repositories contain more than one item. Moreover, the repositories are not updated regularly, which is must. In some repositories, there is also provision for self-submission of publications of individual scholars. The Council of Scientific and Industrial Research (CSIR), an autonomous body of Govt. of India, having 41 research laboratories, scattered all over India, has developed a digital library of electronic dissertations, thesis and research reports of the scholars. The Table 1 depicts important open source IDR, registered in DOAR.

</table>
It appears from Table 1 that most of the IDR uses DSpace or EPrint digital library software. Out of 38 institutes, 10 institutes are directly related to the study and research on Oceanography and allied areas. The National Institute of Oceanography (NIO), a CSIR world recognized laboratory, is the most important research institute in this multidisciplinary subject. One of the important mandates of the institute is to “disseminate knowledge on the water around India” and its IDR is important information resources in the field of marine sciences and related areas. The repository DRS@nio contains research papers, conference articles and Ph.D. thesis of the institute. Total 4924 digital objects in the form of above categories are available in the repository and can be accessed from remote areas free of cost. The repository contains digital objects of various disciplines, such as, chemical sciences (339), biological sciences (1058), engineering and instrumentation (128), geology and geophysical sciences (915), interdisciplinary oceanography (280), marine archeology (180), material sciences (47), physical sciences (595) and miscellaneous (110).

7. Institutional Digital Repository (IDR) of CUSAT

Cochin University of Science and Technology (CUSAT) has developed a unique digital repository, called “Dyuthi”. It is a digital service that collects, preserves, and distributes digital objects to the remote users. This repository is initiated with the financial assistance by the Department of Scientific and Industrial Research (DSIR), under the Technology Information Facilitation Programme (TIFP), Ministry of Science & Technology, Government of India. The Financial assistance from University Grants Commission (UGC) as major research project (MRP) helps to strengthen the repository by covering more scientific productivity other than Ph.D. theses such as scientific publications, conference e-proceedings, multimedia contents, books etc.

7.1. Communities of IDR of CUSAT.

The Dyuthi contains 6 communities, namely, conference proceedings, Erudite, e-scholarship, Ph.d. thesis, preprints and research centres. Among them, e-scholarship and thesis contribute maximum digital resources. E-scholarship is the research paper published by the research scholars, faculties and scientific community of CUSAT. In e-scholarship
community 922 articles published in 24 sub-communities with different subject categories. Most of the sub-communities are multidisciplinary in nature and contain various disciplines. The important areas in the field of Oceanography in this community are chemical oceanography, industrial fisheries, marine biology, marine geology, physical oceanography, ship technology and so on. Digital repositories of Ph.D. thesis contain research output of scholars in the form of dissertation. The total collection in this community reaches 1040 as on 20.01.2012. Amongst them, the faculty of Marine Sciences contains the highest number of Ph.D. thesis with 304 in numbers. There are 958 minute subject categories without any

Figure 3: Dyuthi - digital repositories of CUSAT showing communities and Ph.D. Theses

8. Findings

Most of the IDR built in India uses DSpace open source digital library software. In some repositories full text is not available, and if available, protected by user name and password authentication. Thus, only restricted users can access these resources. It has been observed that IDR does not contain ocean data. Oceanographic information (OI) includes all data of coastal and ocean environment produced and generated by a) monitoring activities b) marine research projects or programmes c) remote sensing observations by satellite, airplane or radar and d) computer models. Various ocean parameters are continuously and periodically collected by different observatories with arrays of sensors and instruments. They continuously measure various ocean properties and events. Oceanographers and scientists require these ocean data for their research work. None of the IDR contains this valuable ocean data, which is the most important and vital information source of oceanographic study and research. IDR contains mostly research articles, conference proceedings, books, reports, patents, thesis and dissertations. The IDR does not follow the standard guidelines and thus uniformity is not maintained for the organization of resources. The number of digital objects shows that preprints from authors are not much popular. Except thesis and articles other grey literature, namely, technical reports, project reports, image files, class lecture notes, question papers are rarely available in IDR. It has further been observed that the magnitude of research publications in the form of journal articles and conference papers published in India is not reflected in the digital repositories. The IDR of CUSAT does not contain theses prior to 1971. The other repositories also are lagging behind in digitizing and publishing earlier and older research output in the form of articles and thesis.

9. Conclusion

It has been observed that the digital objects available at the IDR are not indexed properly and appropriately from the users' point of view. The search criteria of digital resources vary from IDR to IDR and even from community to community within the same IDR. The search criteria do not match with the information seeking behavior or requirement of the users. Subject approach is the prime concern of the users. Users prefer subject search more than other search criteria while seeking information from a digital resource. It is felt that an analysis of the thought content of digital objects available in IDR should be carried out by using Facet Analysis approach as enunciated by S.R. Ranganathan in his General Theory of Library Classification. Accordingly, information resources of marine science should be categorized into different sub-disciplines following standard abstracting services and international thesaurus like, Aquatic Sciences and Fisheries Abstracts (ASFA). The study suggests that the different communities of the discipline marine science should be made under various component ideas associated with the subject as enunciated in Table 2. Each of the sub-division may further be sub-divided into minute divisions as shown in case of biological oceanography. The Ocean Observing System (OOS) has been designed to acquire in-situ meteorological and oceanographic data on real time basis from oceans and seas around India. Various modern observing instruments are being deployed in different areas of the seas to collect in-situ data continuously after specific time intervals. These processed data are valuable not only to the primary users responsible for their innovative research work, but also to a wide range of secondary users, whose work largely depend on marine resources.
both living and non-living. Thus, availability of oceanographic data in the IDR will not only enrich the information sources of IDR but also improves the accessibility of oceanographic information to end-users and ensures that data are preserved for long-term use. The scientists and researchers require ocean data and information on a continuous basis for their research and study, which must be available in the IDR for better and improved user service.

IDR in India has passed one decade and still is not very popular among the academic communities as an essential information source. It is the right time to promote the prospect and benefit of digital repositories in this subcontinent. Orientation and awareness programme should be carried out towards the advantage and use of this technology in this age of information superhighway. The faculties, scientists, scholars and other stakeholders should be encouraged to publish their research work in this digital environment for wider use and better citation. As recommended in the National Knowledge Commission (NKC) on National Mission of Education through ICT (NME-ICT), government departments and autonomous organizations should take initiative through appropriate agencies to release fund in building more institutional digital repositories in the field of marine sciences and allied disciplines.

The paper highlights the management of digital collection Libraries. Previously library which became rich in collection was called a good library. Now the concept of library service has been changed. Computer and communication media have change and revolutionized the whole world. The library has now become paperless and the services of a library which is special in nature have gone beyond the boundaries of the concerned library.

The task of librarians and information professionals has increased manifold as they now have to perform dual responsibility of collecting organizing information in both physical as well as in digital form to help the information users in accessing the same.

In this information age digital libraries are needed. Emergence of digital technology and computer network has provided a means whereby the information can be stored, retrieved and disseminated in faster and efficient manner.

Some of the purposes of digital library that are of direct concern to document management have been discussed in the paper. Some of the activities in the library concerned with managing digital document have been discussed in the paper.

The basic functions in digital document management are:

- Identification and collection of contents to be digitized
- Classification and digitization of these contents
- Editing, formatting and storage of the contents
- Designing search engines to selectively search and access the contents
- Publishing contents digitally for end-user access

(i) **Subtasks**

Each of these functions involves certain subtasks like:

- Transforming printed information into digital form
- Storage, retrieval and handling of “easy-to-use” electronic information.
- Converting data from diverse media or formats into digital format.
- Classification techniques for improving retrieval efficiency.
Managing devices for large massive storage, with multilevel hierarchical storage structures, supporting differing speed storage devices and varied capacity processors.

- Editing and formatting of contents in different formats such as, HTML, VRML, XML, PDF, JPEG, MPEG, etc.
- Browsing and querying facilities for content based retrieval.
- Options to promptly distribute and safely access information via standard communication and computing infrastructure.
- Security of delivered contents by different cryptographic/encryption methods and appropriate firewall mechanisms and access methods through password/IP authentication of clients.

have been discussed in this paper. The paper discussed about Capturing, Formatting, encoding and compression, Content Indexing and Metadata, Organization, Storage, Search Engines/Retrieval and Dissemination of information.

In Bikaner University library and College libraries are also taking steps to make digital library fully. E-mail, Internet Services have been providing to the users. Also steps are being taken to start Video-Conferencing management in these libraries.

Different steps in management of digital documents have been elaborated in detail. Digital document management unlike print document management has its own advantages and challenges and it is upon the library administration and professionals to frame proper programmes and effective action plans to transform these new media of information resources to the benefit of library and its readers. Libraries in India are slowly waking up to needs of managing digital documents to a large extent for rendering current services. The INFLIBNET in India has been making efforts to digitized libraries of all universities and research organization.

By thinking about library, the picture of traditional library i.e., stack room with full of books on all the shelves, issue/return counters, comes in front of our eyes. Computer and Communication media have changed and revolutionized the whole world. Library is not an exception to this change. Earlier in the past the aim of the Librarian was to keep and conserve the documents in the library organization. The library which became rich in collection was called a good library. Now the concept of library service has been changed. The Library which provides services to the users satisfactorily is now called a good library.

The Library has now become paperless and the services of a Library which is special in nature have gone beyond the boundaries of the concerned library. This is due to emergence of electronic media such as computer, Internet, E-mail etc. Information desired by a reader of a particular library can be obtained from outside sources of other libraries. The modern library is equipped with website, e-mail, intranet, TQM etc. In other words, these modern equipments and methods are more challenging, helping and modernizing to extend the facilities of the boundary less institutions to the information seekers.

Digital era is concerned with creating, sharing and using information in digital form. Libraries are an important and indispensable source of information and knowledge which can be applied in various applications such as trade, commerce, economics, scientific research and development and many other areas. The rapid pace and with which computer and
information technology have entered into our lives with new opportunities and libraries are not left behind. Right information at the right time to right person is the demand of today.

The task of librarians and information professionals has increased manifold as they now have to perform dual responsibility of collecting, organizing information in both Physical as well as in digital form to help the information users in accessing the same.

In this information age, we require digital libraries. Emergence of digital technology and computer networks has provided a means whereby the information can be stored, retrieved and disseminated in faster and efficient manner.

1. **Document Management in Digital ERA**

A general discussion on document management in digital form is attempted here.

Some of the purposes of digital library that are of direct concern to document management as:

(i) Collect, store and organize information and knowledge in digital form

(ii) Promote economic and efficient delivery of information

1.1 **Options in a library**

Some of the activities in the library concerned with managing digital documents may include;

(i) **CD-ROM Networking**: Networking CD-ROMs with juke box/CD tower or high capacity hard disk mirroring to serve bibliographic or full text databases, electronic supplements with printed books, CDs cut in-house out of publications/reports of internal activity.

(ii) **Web access of journals**: Current journals could be made accessible from the publisher’s websites either through login and passwords or by specific IP addresses of the institution, without paying extra fee on subscriptions. There are also options to join consortia based electronic access of primary resources through MHRD’s INDEST consortium, UGC Infonet project, etc. Seeing the rapidity by which library automation and CD-ROM technology percolated in the country, there may be many more consortia or at least more and more members to participate in the existing consortia.

(iii) **e-books**: Free/fee books in electronic form.

1.2 **Type of Documents**:

In the library perspective, the term content encompasses all types of information sources or documents which will be of interest to clientele, though the term is getting wider usage now to denote electronic information resources and the subject matter covered in them.

“Content may be anything, including oral language and natural phenomena, that upon observation appears to have a pattern that can be analyzed for descriptive or inferential purposes” according to Penland. If we rephrase the paradigm of Yovits et al. “information to be data of value;” then we get ‘content to be information of value’, as the flood of information forces us to be more and more selective and calls for stricter measures to identify, collect, organize, and disseminate vital contents. Document management or content management is nothing but the systematic application of various tools and techniques for the efficient management of information sources in diverse forms (monograph, journal, reports,
conference papers, website resources, email/listserv messages, etc.) and media (print, optical, magnetic, electronic, etc.). Here we should also consider the shift undergoing from traditional library management practices and the attempts towards achieving futuristic knowledge management systems. Since the contents comprise, to a large extent from formal printed monographs and serials in paper or microforms, the collection development concerns were thrust upon providing “right resource to the right user at the right time” to satisfy the fundamental laws of library science. Whereas in the aftermath of electronic information products and Internet/Web, the barriers between formal and informal sources are becoming greatly reduced and collection development is leading to access arrangement mechanism. In the electronic scenario, it is not the document (often regarded as the carrier or physical form of content), but the content is pervasive and more important. This needs new management principles and alertness as well as trained information support staff to trace, track and control electronic resources procured and available free on the web. The availability of local information that institutions would like to share with others and the computer/communication infrastructure emerging also enabled institutions to publish local contents. Well processed and properly connected information that an institution should use to significantly enhance its utility in its sphere of activity becomes knowledge, thus information-intensive industries are putting considerable amount of money, machines and manpower to conserve and do value-addition to this knowledge. Kalseth identified the various strategies to be adopted while implementing knowledge management, such as, document management, improved access to information, use and reuse of information, access to people, learning by participation, networking/synergies, process orientation, human capital and management culture.

**Contents fall in two groups, internal and external**

Internal (Local) : Research or annual reports and other publication issued by the parent institution affiliating the library. In addition, there are also p/reprints of research publications and proceedings of conferences hosted by the institution.

External : Contents procured from publishers or vendors such as full-text databases, online access of subscribed primary journals. There are also offline electronic media like CDs, floppies etc. Contents in this category are sourced from a wide range of options such as web access rights, open access materials like web information resources, contents licensed through consortia, etc.

1.3 **Steps in Document Management**

The basic functions in digital document management are:

- Identification and collection of contents to be digitized
- Classification and digitization of these contents
- Editing, formatting and storage of the contents
- Designing search engines to selectively search and access the contents
- Publishing contents digitally for end-user access

(ii) **Subtasks**

Each of these functions involves certain subtasks like:

- Transforming printed information into digital form
• Storage, retrieval and handling of “easy-to-use” electronic information.
• Converting data from diverse media or formats into digital format.
• Classification techniques for improving retrieval efficiency.
• Managing devices for large massive storage, with multilevel hierarchical storage structures, supporting differing speed storage devices and varied capacity processors.
• Editing and formatting of contents in different formats such as, HTML, VRML, XML, PDF, JPEG, MPEG, etc.
• Browsing and querying facilities for content based retrieval.
• Options to promptly distribute and safely access information via standard communication and computing infrastructure.
• Security of delivered contents by different cryptographic/encryption methods and appropriate firewall mechanisms and access methods through password/IP authentication of clients.

(iii) Capturing
(iv) Formatting, encoding and Compression
(v) Content Indexing and Metadata
(vi) Organization
(vii) Storage
(viii) Search Engines/Retrieval
(ix) Dissemination

Management of Digital Collection in College of Agriculture and College of Veterinary Animal Science, Bikaner.

Library Automation

Library has already library SOUL Software in the year 2003 and automation of housekeeping work done as per given below in College of Agriculture and College of Veterinary Animal Science, Bikaner.

Software

- Soul Library Software 2.0 Network Version: In Both the colleges
- Barcode Software: In College of Agriculture
- Operating Software (Windows 2003 Server Edition License based): In College of Agriculture
- Application Software (MS-Office 2007 License based): In Both the colleges
- SHARP-DESK Scanning Software: In College of Agriculture

Library Services & Facilities in Bikaner (Raj.)

- Circulation Service: In Both the colleges.
- Reference Service: In Both the colleges.
- Inter-Library loan Service: In Both the colleges.
- Newspaper Clipping Service: In Both the colleges.
- Book-Bank factuality: In Both the colleges.
- Photocopying facility: In Both the colleges.
- E-mail Facility: In Both the colleges.
- Internet Access Facility: In Both the colleges.
- Reading Room facilities (books, journals, newspaper, etc): In Both the colleges

Electronic Information Resources in Bikaner (Raj.)

Online Databases

- CeRA (On-Line) Consortium of e-Resources in Agriculture: In Both the colleges full text Journals
- Krishiprabha (Online Database of theses): In Both the colleges
E-Mail & Internet Facilities:

Library has been providing E-mail & Internet facilities to its users. This facilities the users to access world wide information. - In Both the colleges

Electronic Surveillance:

A) Automation of basic library function:

Library automation is a first step toward the digital library. Automation is required for improving the efficiency of the services to be delivered at all levels. Library functions of our library are being automated with the network version 2 of SOUL Software in both college libraries of Bikaner.

B) Networking of Computer through LAN:

In both the libraries the computer that resides at library and another departments are connected with each other through peer Local Area Network (LAN). This networking is very important as the main users of library are facilities and students. These users can access to the information resources of library from any of the above mentioned areas through the OPAC modules at their convenience.

C) Access to Internet

Perhaps no other recent innovations have impacted the world, especially profession to such a great extent as Internet. Innovative utilize of internet technologies facilitate us to reach at both information resources and users at local and global level much more easily and effectively. The student can achieve their goals easily if they get free access to internet during library hours in the library to carry out their academic work done efficiently and effectively in both the college libraries & Bikaner.

Conclusion

Libraries in India are slowly waking up to needs of managing digital documents to a large extent for rendering current services. Digital document management unlike print document management has its own advantages and challenges and it is upon the library administration and professionals to frame proper programmes and effective action plans to transform these new media of information resources to the benefit of library and its readers. The Inflibnet in India has been making efforts to digitized libraries of all universities and research organization.

Abstract: Collection development and collection management both are an important function of all the libraries. Importance of Library's collections is to support and benefit for the teaching, learning and completing research needs of the staff, students, teaching professionals and other users who need to seek information. The main responsibility for development of the collections in libraries is shared between academic staff, library committee, Librarian and Library staff. Librarians are trying to get the information resources available in print and other forms in the library to fulfill the needs of the users from the collection. The collection building in libraries has certain aim. In present era of digital information acquisition of resources is not simple due to many reasons like information explosion, increasing number of E-publications, price negotiation, user's demands for e-publications, more use of Internet resources, evaluation of resources, limited budgets multiple resources etc. Librarians are facing many challenges in building the proper collection and managing it for the future use. The authors of this paper tried to highlight the best practices to be used in the libraries for developing proper collection and its management. To collect proper collection in libraries, there is a need to develop standard practices or policies to make the collection effective. The importance is given for developing a policy for collection development and related policies associated with this, which are not generally available in written forms in most of the libraries. The model policy for collection development and management is prepared and presented in this paper based on critical study and review of the existing national and international policies like Library of Congress, IFLA, ALA, UGC, and AICTE etc.

Key Words: Collection Development; Collection development policy,

Introduction:

The libraries are now functioning as Information or Knowledge Centers, resource centers, which disseminates required pinpointed information to the users. Libraries collect the information published in various forms e.g. books, periodicals, thesis, patents etc. and organize it in helpful sequence. The heart of the library is in its collection. The main purpose of the collection is to serve the needs of users and organizational aims in better ways. Libraries have to develop the collection keeping in view the users need and demands and hence the collection development in the library must be proper. Traditional Libraries have some set of rules framed for the collection development but not operative, but now due use of ICT, revolutionary changes have been observed in the library practices including collection development. The framed rules are not appropriate and suits to the changing practices and hence majority of the libraries in the developed countries have formulated the collection development policies to build the proper and useful collection in the libraries which supports to the needs of the users. Similarly the change in format from print to digital made the issues to develop new policies or to amend the existing policies to suit the environment.

In digital media acquisitions the process is different due to change in format and pricing structure as compared to previous methods followed in libraries.
Collection development is the main activity of any library and hence librarians are now focusing more in this area. To maintain the proper collection in libraries there is a need to develop policies or amend to the existing to suit the emerging trends in publications and acquisition methods. The increase in digital media publication and usage the collection development policies for the digital information resources are required to be developed. The process of the collection development covers selection and de-selection of the resources. Collection development or management involves activities like collection management program, collection development policy statement, collection assessment, funding & budgeting, selection and de-selection, preservation, and resource-sharing projects (Verzosa, http://www.slideshare.net/verzosaf/the-changing-nature-of-collection-development-in-academic-libraries). It is very clear from the statement made by Verzosa that collection development process is a complex process involving various activities but its advantages are more to have a proper collection.

**What is collection Development?**

The purpose of collection development pointed out by Melvil Dewey was to provide “The best reading for the largest number at the least cost.” ALA (1995) defined a very suitable definition for collection development as “A term which encompasses a number of activities related to the development of the library collection, including the determination and coordination of selection policy, assessment of needs of users and potential users, collection use studies, collection evaluation, identification of collection needs, selection of materials, Planning for resource sharing, collection maintenance and weeding.” ALA Glossary (ALA, 1995) State that “Library Collections will contain all types of registered information, including printed materials of all formats, audio-visual materials, visual material, materials used with computers, graphs and three-dimensional materials and ways to access the electronic information” Harold Libraries Glossary defined “collection developments as the process of planning a stock acquisition programmed not simply to cater for immediate needs but to build a current and reliable collection over a numbers of years to meet the objectives of the services.” These definitions clearly indicate the need of collection development in information growing age. If libraries need to provide qualitative services then qualitative collection is to be made available in the library irrespective of forms and formats.

**Why Proper Collection Development:**

Collection of the documents in the library is the prime task as it is the power house of information resources. There are many factors involved to have proper collection development like

- Information explosion and Information overload
- Limited and shrinking library budgets
- Increasing users demands for pinpointed qualitative information resources due to specialization
- Multiple forms and formats of the information resources including digital
- Increase in prices of documents all the times
- Shift in demand of users from collection based services to information and access based services
- More usage of Internet based e-documents

Since digital, internet resources, databases and e-publications are increasing and simultaneously the use in academic and special libraries are also increasing continuously.
Growth in literature made necessary to manage proper collection.

**Objectives and Purpose of Collection Development:**

The main objectives and purpose behind collection development are

- Fulfill the user needs by proper collection
- To support the teaching learning and research endeavors
- Periodically review the collection for weeding
- To provide nascent and relevant information
- To acquire the best and useful literature to the core group of the users

Collection Development policies allows the library personnel's to develop proper collection and based on this value added services can be provided to the users. The purpose of the collection development policy is to provide guidelines for day to day acquisition and withdrawal decisions, resource allocation and long range planning of collection needs keeping in mind the library mission, activities, organizational needs and interest etc.

**Techniques for Proper Collection Development**

For proper collection development for any library, a detailed written collection development policy is necessary. The policy clearly specifies the organizational requirements, goals and the user needs in specific. The Library committee formed for the proper development and progress of the library consist of the expert members from the various faculties who can contribute in formulating the proper collection development and designing the policies. It is also necessary to look in to the policies formulated by the other libraries and the policies prepared by LC and ALA etc. Library collection development policy should be in clearly spelt out in a written form. The American Library Association's collection development policies assumed that a written collection development policy is a desirable tool that enables selectors to work with greater consistency towards defined goals.

The following aspects need to be considered basically while developing policy:

- Users needs and demands (Real and potential)
- Review the organizational needs and objectives
- Review the standard, core, border and peripheral subject areas
- Conduct use and users studies for user behavior and need analysis
- Try to cover the sources which disseminate maximum access to current information in the area
- Take the help of techniques like citation analysis, impact factor, bibliometrics and scientometrics studies, information audit, information behavior of users etc
- Resource Sharing practices be initiated at various level including consortium
- Evaluation techniques must be adapted
- Trial access for the databases for certain period and get the feedback from the users before subscription
- Initiate the OA and IR project for protecting IP of organization
- Analyze strengths and weakness of the collection regularly
- Apply management techniques for quality procurement
Many libraries have developed collection development policies but these are informal in nature and no concrete policies are developed except larger organizations. The collection development policy is required due to multidisciplinary subjects, procurement of e-publications. Policy is a guideline to act on. To prepare a policy for any library a review of different standard collection development policies becomes useful to draft a policy.

**Review of Existing Collection development policies: (National and International)**

1) The basic elements while formulating the collection development policy for any library was discussed in the conferences also and the output presented in the National Conference on “Putting Knowledge to Work: Best Practices in Librarianship” 1-2 May 2009 151-152 highlighted following issues.

- **Organizational Objectives**: The nature of the organization, its function, objectives and the purpose must be considered at the initial level.

- **Users**: It is necessary to review the needs of the users of the library especially from the organization, their main area of concern, projects under taken, information resources covering the general aspect about the stream as well as the specialized needs of the users in the area of research. Real and potential needs of the users must be covered.

- **Level of collection**: The collection may satisfy the needs of the experts as well as a common man whose interest is to read for the entertainment and knowledge addition. (Maslow’s need based triangle). There is a need to focus on the current and future needs of the organizations.

- **Subject Coverage**: It is necessary to fix the core subjects in which organizational collection must be deep and updated. The peripheral subjects can be developed based on the priority as well as need based collection or even can be shared with other organizations (Resource Sharing). Hence collection assessment must be evaluated based on the area and subjects of core importance.

- **Type of Information sources**: While selecting the information recourses it is necessary to provide the access to the literature published in the area which is covered by the secondary information sources. It is necessary to provide maximum access to the users rather than owning the information resources. To make the collection economic on demand acquisition can also be preferred in case of peripheral area or can be obtained from ILL.

- **Budget**: Allocation of the budget must be proper and as per the usage. The budget of any library is not adequate to get all the literature published and hence policies must be fixed keeping in mind the usage and cost effective factors. Resource sharing activity will also help in reducing the expenses in case of peripheral research area.

- **Forms in which material must be acquired**: It is necessary to fix the form in which documents can be acquired. A policy stating the forms (print, digital, non print etc) to be procured must be detailed. However the acquisition must always be cost effective to adjust in the budget allocated.

- **Services provided**: Many libraries provide services to the users from the organization as well as from different institutions. For this purpose the acquisition must be qualitative.
• **Users and use studies at frequent Intervals**: It is necessary to evaluate the usage of the acquired material. If the material is less used it must be weeded or stacked in parallel.

• Policies for the preservation of the resources: Preservation of the literature is the objective of the library. The heritage of the knowledge is useful for the future generation and hence modern tools and techniques may be used.

Apart from these instructional methods, curricular needs, research requirements, frequent user need analysis, assessment and evaluation is considered while framing the policy.

**2) IFLA Policy for Collection Development:**

The IFLA suggested following points in its collection development policy

- Must be a written Policy covering procedure for selection, de-selection planning (future), public relations, weeding, retaining, preservation etc
- Covers general, narrative and subject profiles
- Use of collection evaluation methods
- Use of collection depth indicators
- Language (English, Primary and predominantly used as per need and country language)
- Policy implementation and revision

The first elements of a collection development policy will be a mission statement of the library, the purpose of this policy and the audience to whom it is addressed.

General area covers current focus or also retrospective acquisitions; the resource types (monographs, periodicals, theses, gray literature, maps, etc.); languages; formats (printed, non-print or electronic); special sources of funding (a grant or gift from a donor); the policy regarding gifts and any special policies regarding maintenance (weeding, discarding, preservation) of the collection; and size of the collections.

- Under quantitative measures

Collection evaluation is based on quantitative and qualitative measures

- Quantitative Measures reveal size, age, use, costs and other numeric data. Examples of quantitative measures include inventory, or shelf list measures to determine actual title or volume counts, by segment or subject area. Median age or similar measures indicate the currency of the materials. Amount expended for acquisitions in a segment or subject area per year illustrates the ongoing commitment to develop that area. Percentage of titles owned by a library when compared to a standard list shows the breadth and depth of the collection. Use statistics (including internal library use and ILL) are both collection and client-centered.

- Qualitative measures are obtained through subjective evaluation and involve the professional judgment of librarians, appraisal from subject experts, or the opinion of customers. These techniques include impressions of the condition, character and appropriateness of a section of the collection. Another qualitative technique is the judgment made by comparison of one subject in the collection to a similar subject in another library, or to a subject bibliography
Collection depth indicators indicated are: current collection level, acquisition commitment and collection goal. Indicators define out of scope, minimum information level, basic information level, study and instructional support, research level, comprehensive level etc.

Each institution, including its community and other constituents, is unique. Therefore, its policy statements will be unique. The policy statements should reflect this particular library and the community it serves.

3) ALA Policy: (http://www.ala.org/acrl/guides/college.html)

ALA covers following standard elements in its policy developed for academic libraries (College)

Standards 1: Mission, Goals, and Objectives of institution

Standard 2: Collections: including print materials in all formats, audiovisual materials, sound recordings, materials used with computers, graphics, and three dimensional materials. A formula is also presented in terms of collection development in the policy

Standard 3: Organization of materials: Library collections shall be organized by nationally approved conventions and arranged for efficient retrieval at time of need. The processing methods need to be applied for this purpose.

Standard 4: Staff: The staff shall be of adequate size and quality to meet the library's need for services, programs, and collection organization. A staff formula is also presented in the policy

Standard 5: Services: The library shall establish, promote, maintain a range and quality of services that supports the academic program of the institution and encourage optional library use.

Standards 6: Facilities: The library building shall provide well-planned, secure and adequate housing for its collections and personnel; secure space for users and staff, and space for the provision of services and programs. A formula is also presented to calculate the space for per vol/Per Sqft

Standards 7: Administration: The college library shall be administered in a manner which permits and encourages the fullest and most effective use of available library resources.

Standard 8: Budget: The library director shall have the responsibility for preparing, defending, and administering the library budget in accord with agreed upon objectives.

These standards provide the guideline for formulating the policy.

4) University Grant Commission (UGC) Collection Development Policy (College Libraries)

The UGC policy stated following points for collection development

- Library Committee and its constituents (Chairman, member secretary, members, student representative)
- Library Collection norms based on courses, students and faculty
- Technical Processing.
- Library Finance
- Library Services
- Library Personnel
- Physical Facilities
5) **AICTE Collection Development Policy for Engineering College Libraries**

All India Council for Technical Education (AICTE) has formulated norms or policy for development of library collection including number of titles and their volumes, number of national and international journals including e-resources made available through INDEST-AICTE. The main elements covered with formulas are:

- Collection of Books and Journals (Print Reading Material)
- Collection of Electronic Resources (e-journals and e-books etc)
- Library Personnel and Library Building

6) **Library of Congress. Collection Development Policies** (http://www.loc.gov/acq/devpol/)

The Library's Collection Development Policy is a guide for materials to be added to the Library's permanent collections. The Collection Policy Statement (CPS) governs the Library's collection development and acquisition efforts. The statements implement the Library's responsibilities to serve. The policies provide a plan for developing the collections and maintaining their existing strengths. The highlighted points in to this policy are

- Collecting Levels: Out of scope no need to buy, minimum level, basic information level, instructional level, research level, comprehensive level
- Collection Overviews: scope, research strength,
- Selection Guidelines for Electronic Resources: evaluate contents, add value, server reliability, judicious use of multimedia, adherence to copyright and fair use guidelines, provision of links to source for the plug-in-software, organization and ease of navigation, presence of search and help features, procurement of Standard Fee based resources with permanent retention.

From the above review of policies following components / elements could be considered while developing collection policy for libraries.

Components for Collection Development Policy:

From the analytical study of the collection development policies it is understood that minimum components to be considered are:

1) **Selection** : covers purpose (free or purchased) teaching, learning, research and needs of staff and students; responsibility (Staff and librarian), Format (Print or digital), Language, special collections
2) **Allocation of resources** : considerations based on need based requirements and on demand procurement and provide more access to information than possession.
3) **Collection maintenance** : retention policies considering usage, main stack, parallel stacking, compact storage, weeding, retro-conversion etc are properly applied for better management and reduction in cost.
4) **Preservation** : rare and useful collection is to be retained for longer use and needs proper preservation manual or converting to digital
5) **Access** : open access or authority permitted to consult in case of rare and confidential.
6) **More use of e-publications** : the print media is shifting to e-publications and databases and more use is observed in the present generation.
7) **Network based resources and consortium arrangement:** These are also to be considered while planning collection economically

8) **Resource sharing and IR initiatives:** Open access and IR and resource sharing initiatives need to be considered

**Best practices:**

There is a need to develop proper collection in different forms. Collection development policies are to be framed for digital collection also as these documents may increase in the collection including acquisition and resource sharing policies. The policies need to be revised regularly. Policy supports to customer-focused needs, so that library users have access to current, relevant and authoritative information in their preferred format.

**Conclusion:**

Proper Collection Development needs review and evaluation of resources before acquisition. The collection must be based on collection development policy consisting of different policies like selection, de-selection, preservation or retention, digital conversion, stack management, weeding policies etc. Activities like supporting to customer-focused needs, so that library users have access to current, relevant and authoritative information in their preferred format. User need analysis needs to be assessed regularly. Collection Development in libraries is the process of planning and acquiring a balanced collection of documents in any format including online databases and electronic information resources. Hence it is necessary to develop different policies to simplify the functions of library and information centers. Collection development is complex due to new technologies and formats. Changes in the technology, book publishing and trade industry and new techniques for library collection and are responsible for shaping the collection development policies. However the collection development policy formulated by any library must put more trace on the quality of information resources than quantity.

Digital Library: Easy way to buildup

Shyamal Ghosh
Pailan College of Management & Technology
Pailan, Kolkata, 700104, W.B
E-mail: sg.libsys@gmail.com

Abstract: Rapid growth of Information and Communication Technologies made it possible for the libraries to serve the information need of the users without wasting their valuable time. No library is meant for just proving bibliographic services. Instead they opted for full-text articles service which is agree with the laws of library science. Now libraries prefer to set up digital libraries to provide enhanced library services. Digital library is not merely a collection of electronic information, it is an organized system of digitized information that can serve as a rich resource for its user community. A number of commercial and open source softwares are already available for creating a digital library and fulfill the actual needs of the users. Building up a digital library needs a foolproof plan and effective use of any of the digital library softwares like, Greenstone, Dspace, E-print etc. The present paper describes the steps involves in planning for building up a digital library with Greenstone digital library (GSDL) software.

Keywords: Digital library, Open source software, GSDL

1. Introduction

Nowadays academic library is a collection of not only more printed books and journals but also digital resources, where both the forms of the documents can be stored (archived), read (browsed), retrieved and delivered as and when required by a user. Information is accessible from a wide variety of globally distributed commercial repositories such as electronic publishers and aggregators with access charge. However, it is also accessible from open access journals, open access archives and institutional repositories free of charge. Digital library is not merely a collection of electronic information, it is an organized system of digitized information that can serve as a rich resource for its user community. A number of commercial and open source softwares are already available for creating a digital library and fulfill the actual needs of the users.

2. Digital Library: what?

According to Smith (1997), digital libraries are “controlled collections of information bearing objects that are in digital form and that may be organized, accessed, evaluated and used by means of heterogeneous and extensible set of distributed services that are supported by digital technology.”

Digital library collect and store information through electronic or digital medium. The digital information collections may include books, scanned images, graphics, textual and numeric data, digitized films, audio and video clips, etc. A digital library is expected to provide access to the digital information collections and distributed globally for the users.

3. Digital Library: why?

Digital libraries evolved in response to need to manage the vast quantities of information and knowledge that we presently produce, collect, access and consume in electronic form.
Architects of digital libraries have adopted a variety of design approaches, interoperability standards and practices to provide users with seamless access to highly distributed information sources. Digital library is part of the global information infrastructure being envisioned to interconnect computer networks and various forms of information technologies around the world. It is more organized and structured than the World Wide Web (WWW), an overwhelming example of a shared collection of worldwide information and knowledge.

Digital libraries, whether individual or distributed, are constructed according to some design and architecture. These digital libraries are built upon suitable technologies and must support operations as well as functions as integrated systems to support a target user community. While there are generic needs common for most digital libraries, such as archiving, searching and browsing, but specific communities often require specialized services and prefer particular types of user interfaces and display formats. Individual systems (i.e., individual digital libraries) must address to standards, digital preservation, indexing styles, logging, security, and tuning. In case of distributed digital libraries, requirements are also there for data federation, interoperability, scalability, service federation and web services.

The principal reason for setting up a digital library is to overcome two factors that are time and space. Alternatively, we can say that the objective of formation of a digital library is to reduce the time and effort of the users to get access to their required information resources. The other reason for building up a digital library is to cope up the situation arising out of information explosion, dwindling library budget, high information demand. The availability of technology, finally, reduce the time to get information.

4. Objectives

The main objectives to build digital libraries are as follows:
   i. Quick access of information from the vast sources of digital information.
   ii. The digital library may be distributed or centralized collection but can be accessed from any desktop of the system.
   iii. Pinpointed source available for the user.
   iv. It collects text, audio, video, graphics animation, and any other form of materials without changing of their content. It connects information service centres to serve end user.
   v. To avoid the duplication of work.
   vi. It helps to cope up with the financial constraint of the library. It saves the time of both library staff and user.
   vii. No physical maintenance of library materials is required.

5. Creation of a digital library: a study based on GSDL

Greenstone is comprehensive software for constructing and presenting collections of thousands or millions of documents, including text, images, audio, and video. A typical digital library contains many collections, individually organized-although they bear a strong family resemblance. Easily maintained, collections can be augmented and rebuilt automatically.

Collections are designed to be easy to use. Greenstone can be installed on any computer using Windows or Linux as operating system. Collections can be used locally on the computer where the software is installed; also, if this computer is connected to a network, remote users can access them using an ordinary web browser like Internet Explorer, Mozilla or Netscape etc.
5.1 **Hardware**

Digital library requires a high-end server with huge storage capacity, desktop computers, mirror server, LAN with Internet connectivity, uninterrupted power supply, scanner etc. However, these entire hardware requirements depend upon the library size, collection, number of users and considering probable growth in the next ten years etc.

5.2 **Software**

Present study requires two types of software to create digital library. Firstly, Digital library software which deals with organisation of the collection likes GSDL. Secondly, associated software like Operating system (Windows), Apache & Pearl (if required Web version), Java Run Time Environment (J2RE) and Java Development Kit (JDK), Image Magick, Internet Explorer or Mozilla (Browsing purpose).

5.3 **Metadata**

In Digital library system metadata is essential requirement for cataloguing digital resources. This data is to be stored in the system using one standard metadata of them. The purpose of this metadata is to store information about electronic resources including electronic journals; e-books etc for quick searching of information and to serve its communities. Many Metadata standards available but used in our library Dublin Core Metadata which is internationally accepted. The core elements are Title, Creator, Subject, Description, Publisher, Contributor, Date, Type, Format, Identifier, Source, Language, Relation, Coverage, Rights.

After installation we check whether your installation is proper, Click on 'Start ? Programs ? Greenstone Digital Library'. Click on Enter Library in the 'Dialog Box' and Your Browser should display The GSDL Homepage.

6. **Working with Greenstone Librarian Interface (GLI): different panels**

GLI is quite easy and simple for handling. In this software we use the 'Gather', 'Enrich', 'Design', 'Create', and 'Format' panels for making, configuring, customizing and managing collections.

The ‘Gather’ panel facilitates putting the relevant files from the 'workspace' to the 'collection building' area. The 'Enrich' panel explains how metadata is created, edited, assigned and retrieved, and how to use external metadata sources. Help for this menu is provided in the GLI Interface. The 'Design' panel facilitates customizing the interface, once your files are marked up with metadata. Using the Gather Panel, we can specify the fields that are searchable, allow browsing through the document, facilitate the languages that are

![Figure-1: Collection title](image-url)
supported, and provide the buttons that are to appear on the page. Help for this menu is also provided in the GLI Interface. The Create Panel facilitates creation of collection.

6.1 Steps by step entering in GSDL

First step open file and create new collection title

Go to file menu and select Central library and click on open.

Steps for data Gather:
If file is already stored in any drive then drag and put on collection.

Steps for data Enrich:
Go to enrich and fillup element like Manage Metadata sets - This feature allows you to add, configure and remove the Metadata sets in your collection and what Elements they contain like figure(4).

General Options - In this section, give the e-mail address of the 'collection creator', 'collection maintainer', 'collection title' (will be supplied by the system), collection folder (will be supplied by the system), Image file location for the Collection icon and the Image file location.
location for the Document icon. Click on the Tick mark for making this collection publicly available like figure(4).

**Step for Design:**

Now come to Design part and set the document plugins, Search Indexes, Partition Indexes and Browsing Classifiers like below:

**Document Plugins** - This section facilitates adding, configuring or removing plugins from collection. To add one, choose it from the combobox and click 'Add Plugin'.

**Search Indexes** - The required number of searchable indexes the collection must have, is to be selected here. To add a new index, enter a unique name for the index, select material/metadata to be indexed, and click 'Add Index'. If you wish to add all of the available sources so as to have indexes built on them, then click 'Add All'.

**Partition Indexes** - This feature helps to refine index creation. This facility is disabled in the GLI mode.
Browsing Classifiers - This feature allows the A to Z browsing of the collection and by default it takes the 'Dublin Core'. You can more data elements in the A to Z classify list as deem fit for the collection using this feature shown in figure(7).

![Figure 7: Browsing Classifiers](image)

**Step for Create:**

Then go to create part and click on Build collection figure (8).

![Figure 8: Build Collection](image)

**Step for View Document:**

Now click on Preview Collection and browsing come under the picture. Greenstone Digital Library provides easy browsing facility. User can choose some searching by click on search button.
7. Conclusion

Digital libraries today encompass a variety of resources, patrons and accordingly varied applications. The software packages that powers digital libraries should therefore take into consideration the popular expectations of digital libraries. Open source GSDL software is easy to install and use. It can be used to create digital collections ranging from a small library to a large one. The facility of having a graphical user interface (Web browser) and command line interface of GSDL is very advantageous. Overall, GSDL is very flexible software. It uses open standards for the digital library operations that enhance its tenacity to bear with the technology upgrades in future.

Need for Electronic Resource Management in Academic Libraries: a Case of The West Bengal National University of Juridical Sciences

Shrabani Ghosh

The W.B. National University of Juridical Sciences
12 LB Block, Sector-III, Salt Lake City, Kolkata-700098
E-mail: rshrabani_ghosh@yahoo.co.in

Abstract: Academic libraries in India are not lagging behind from their counterparts in developed world in terms of acquiring and maintaining electronic information resources focused on the areas of their respective clientele. Libraries are subscribing to various electronic aggregator databases, as well as e-journals, either through consortium mode or subscription by individual library. The enormity of the information resources provided by various database vendors and aggregators have necessitated for library professionals to think about Electronic Resource Management (ERM). Many ERM systems have been developed by various vendors to make the task easier for library professionals. Different issues have to be considered while implementing ERM from acquisition to implementation, and staffing & workflow. E-resources can either be integrated with OPAC, or record management, either through alphabetical listing or subject wise classification, would be needed for the maintenance of non-OPAC systems. This study focuses on the need for ERM in legal information systems, with a special focus to the NUJS Library & Information Centre. Three electronic aggregators and publisher in legal information system, viz., LexisNexis, Hein-Online, Westlaw have been chosen for the study. The need and possibilities for union listing of these sources of information would be analyzed and explored.

Introduction

Since the last leg of the last decade of 20th century, academic libraries world over have been shifting to the acquisition of more and more electronic resources which requires licensing and authentication. This has been witnessed that along with the explosion of electronic resources, and their access in academic library environment, users' behaviour and attitude towards the use of these resources have been vastly changed. Users' expectations from the library have evolved, as they find now more information from the web. They now expect the same level of simplicity, power and ease of use from the library services [1]. These developments have posed before the academic librarians newer challenges of successfully managing their collection of electronic resources.

To initiate the discussion, we must delineate the concept of electronic resource management. Electronic resources, as described by the AACR2, are materials consisting of data and/or computer programme(s) encoded for reading and manipulation by a computer, by the use of a peripheral device directly connected to the computer, such as a CD-ROM drive, or remotely via a network, such as the internet. The Online Dictionary of Library and Information Science (ODLIS)[2], describes electronic resource as a category of resources which includes software applications, electronic texts, bibliographic databases, institutional repositories, web sites, e-books, collections of e-journals, etc. The term “Electronic Resource
Management (ERM), according to the Dictionary, is referred to the systems developed to assist librarians in the control of license third party resources published electronically (databases, e-books, e-journals, etc.), including license management, renewal, legal use, access management, and collection development. The Encyclopedia of Library and Information Sciences [3] describes ERM as an evolving array of problems, tasks, processes, and practices associated with the management of electronic resources such as databases, electronic journals, and electronic books in libraries. In the Report of the DLF ERM Initiative [4] describes a related term, i.e., “Electronic Resource Management System (ERMS),” which refers to systems that support “management of the information and workflows necessary to efficiently select, evaluate, acquire, maintain, and provide informed access to electronic resources in accordance with their business and license terms.” ERM System should support the service requirements of e-resources, while there should be “seamless interaction and efficient sharing of data with traditional MARC-based online catalogs, web portals, federated searching tools, local resolution services, local authentication and access management systems, and traditional library management functions.” Further, the DLF Report conveys that an ERM System, whether implemented as a standalone system or as part of an existing library management system, should compliment, rather than duplicate the capabilities of other systems deployed by the library. Some functional requirements, as identified in this report, are resource discovery requirements, bibliographic management requirements, access management requirements, staff requirements, resource administration and management functions and business functions. Other studies also highlights many functional areas of ERM. These are acquisition/purchase process, licensing, setting up access, invoicing/payment problem solving, cataloguing/OPAC work, record management/maintenance of non-OPAC systems, proxy server management, union listing, trouble shooting access problems, system support, site monitoring, setting up/maintaining links to e-journals from indexing & abstracting databases [5]. The integrated library management systems can not describe the hierarchical nature of electronic resources, as these resources are mostly part of databases, which are provided by publishers and electronic aggregators. The other way of describing e-resources is through selection and organization of information resources through portals or gateways. Library portals enhance the value of e-resources with functions such as resource description and discovery, combined searching of multiple resources, context-sensitive linking (openURL framework), and personalized services. Various commercial vendors have come into the market with their highly featured products and services to allow patrons to maximize the use of e-resources in the most efficient way, as well as to make the task easier for LIS professionals to successfully manage these resources.

The present study aims to focus on the importance of bibliographic management of electronic resources for the purpose of resource discovery. The study is undertaken at the NUJS Library and Information Centre of the W. B. National University of Juridical Sciences. The library subscribes to many electronic databases in the field of law and social sciences, of which only three legal databases, viz., LexisNexis Academic, HeinOnline and Westlaw India are selected here for this study.

Overview of the Legal Information System: The law as a discipline has grown over many centuries. The legal system varies from country to country and is mostly evolved through the process of evolution [6]. Common Law Systems: Common law and equity are systems of law whose sources are the decisions in cases by judges. Alongside, the system has a legislature that passes new laws and statutes. The doctrine of stare decisis, literally “to stand on what has been decided,” or precedent by courts is the major innovation and difference to codified civil law systems. The system was developed in United Kingdom and within Great Britain each jurisdiction developed its own forms of common law, with Scotland being especially distinct
from the rest. Since that time, new laws and law reform have increasingly been brought about through acts of Parliament, usually inspired by the Government policies. Even so, the development of case law still remains an important source of law.

**Civil Law System:** Civil law system is the most widespread legal system today and known as European Continental law. It has evolved from Roman law, which was based on written “civil code.” Civil law today, in theory, is interpreted rather than developed or made by judges. Only legislative enactments (statutes, rather than judicial precedents) are considered legally binding. However, in reality, courts do pay attention to previous decisions, especially from higher court. A country may follow either of these two legal systems or a mixed system.

Many types of information are needed to support legal decision-making. Legal decisions cannot be made out of their economic, social, historical, and political contexts. Legal decisions often involve business, scientific, medical, psychological, and technological information. Consequently, legal research are more often interdisciplinary and multidisciplinary in nature.

Published legal resources can be divided into three broad categories: 1) primary sources or authorities; 2) secondary sources; and 3) index, search, or finding tools [7]. Primary sources are authoritative statements of legal rules by government bodies. They include opinions of courts, constitutions, legislations, administrative regulations and opinions, and rules of court. Because many primary sources are published in the order they are issued with little or no subject access, secondary sources and indexing tools are needed to identify and retrieve them. Secondary sources are materials about the law that are used to explain, interpret, develop, locate, or update primary sources. The major type of secondary sources are treatises, restatements, legislative histories, law reviews and other legal periodicals, legal encyclopedias, law reports and legal dictionaries. Index, search, and finding tools help locate or update primary and secondary sources. The major types of finding tools are digests, annotations in annotated statutes and codes, citators, and legal periodical indexes. Law is a subject so dependent on written words and their meaning that having the skill to extract all the required information from a catalogue index or database is one of the basic abilities a lawyer should possess.

Now, we can analyze the relative strengths of the three databases chosen for this study. Basically, their differences are of the jurisdictions each of this commercial database covers.

**LexisNexis® Academic**

LexisNexis® is a leading global provider of content-enabled workflow solutions designed specifically for professionals in the legal, risk management, corporate, government, law enforcement, accounting, and academic markets. It provides access to the customers more than 45,000 legal, news and business sources containing billions of documents and records. LexisNexis encompasses authoritative legal-publishing brands dating back to the 19th century including; Butterworth® in the United Kingdom, Canada, the Asia-Pacific region, Les Editions du Juris Classeur in France, and Martindale-Hubbell® and Matthew Bender® worldwide.

LexisNexis contains US legal documents, international legal documents and companies’ information, with Company profiles, directories and analysts’ reports etc. This is collection of 24 databases which include Administrative materials & regulations, Companies and organizations, Cases, Dictionaries, Intellectual property records, Law reviews and journals, Legal news, Treaties and international agreements, Boards panels and tribunals, Citators and digest, Constitutions, Law directories, Legislations statutes and codes, Scientific materials, Treatises and other materials, among others.
LexisNexis Sources

Among these sources, Law Reviews and Journals covers more than 900 publications. These are arranged in alphabetical order and each journal is linked with Source Information which gives details of the journal's coverage, frequency, update-schedule, language, content-summary, publisher etc. The Journals are primarily published from the United States, with publications from almost all the States and many Law school publications. The database is not browsable. Article level searching can be done either by Easy Search or Power search.

The content of LexisNexis® Academic is designed keeping in mind the information requirements of both the legal scholars and the legal practitioners, whether they are in litigation practice or company lawyer. This is clearly evident from the Companies & Organization database which covers 43 million companies and is unique to LexisNexis, as compared with the other two legal databases chosen for the present study.

Hein Online

Hein Online is Hein's premiere online product with more than 70 million pages of legal history available in an online, fully-searchable, image-based format. A major source for researchers in legal history, this database provides comprehensive coverage from inception of more than 1,600 law and law-related periodicals. Hein Online is the world’s largest image-based legal research collection and contains more than 9 centuries of legal history. Hein Online is a product of William S. Hein & Co., Inc., a legal publisher, periodical subscription agent, and the world’s largest distributor of legal periodicals. This aggregator presently provides a total 42 databases of legal information sources. A few of these databases are being subscribed by The WBNUJS Library and Information Centre. The legal information sources are predominantly United States centric. However, the Law Journal Library also contains various international and non-US law journals. Hein Online also contains the English Report which dates back to 13th century and a key source of case laws of the United Kingdom. Another important information resource is World Constitution Illustrated, which gives account of the constitution of all most all the countries of the world. The Legal Classics library provides access to more than 2300 monographs from some of the greatest legal minds in history. Foreign and International Law Resources Databases (FILRD) includes the publications of the American Society of International Law along with prominent Yearbooks from around the world, including the Hague Permanent Court of International Justice series. It also includes U.S. Law Digests, International Tribunals/Judicial Decisions and more.

1. Legal Classics

This collection includes more than 2,400 works from some of the greatest legal minds in history including Joseph Story, Jeremy Bentham, William Blackstone, William Holdsworth, Henry Maine, Federick William Maitland, Frederick Pollock, Benjamin E. Cardozo, and many more. In addition to many "classics", this collection also includes rare items that are found in only a handful of libraries around the world.
2. **World Constitutions (New)**

This collection will contain current constitution of every country in the world in its original language, as well as their English translations. Hein-Online is working to identify and acquire the source documents for every historical constitution for every country. As historical documents are identified, they will be added to the constitutional timeline for each country. Documents identified, but not yet acquired by the database provider, will be listed to provide a documentary history of the constitution's development. For every constitutional document, researchers will find the original text, amending laws, consolidated text, and important related texts.

3. **European Centre for Minority Issues**

The ECMI conducts practice-oriented research, provides information and documentation, and offers advisory services concerning minority-majority relations in Europe. This library contains several publications of the ECMI, including ECMI Reports and Working Papers. The Journal of ethno-politics and minority issues in Europe is covered from 2000-2011.

4. **English Reports, Full Reprint (1220-1867)**

The English Reports, Full Reprint (1220-1865) online edition delivers exact page-images of the original bound reprint edition, containing more than 100,000 cases, together with the Indexes and Book of Charts. In addition, multiple navigation tools, such as a Case Locator, Chart Tool, and an Advanced Search feature enhance the ease of access to specific cases.

5. **U.S. Supreme Court Library**

This library offers the complete coverage of the official US Reports from 1754-2007. The U.S. Reports are the official records of the rulings, orders, case tables, and other proceedings of the Supreme Court of the United States. Other notable titles in this library include the Constitution of the United States of America, Rules of the Supreme Court of the United States, U. S. Reports Preliminary Prints, U. S. Reports Slip Opinions, and many more historic works related to the Supreme Court of the United States.

6. **U.S. Statutes at Large**

This database covers statutes at large from 1789-2008 and early federal codes and compilation of statutes.

7. **U. S. Presidential Library**

This collection includes such titles as messages and papers of the Presidents, public papers of the Presidents, Code of Federal Regulations Title3 (Presidents), daily and weekly compilation of Presidential documents and other documents related to the U.S. Presidents including biographies and autobiographies.

8. **U.S Federal Legislative History Library**

In addition to the inclusion of comprehensive federal legislative histories published by the U.S. GPO and private publishers, this library also includes a unique finding aid based on Nancy Johnson's award-winning work, Sources of Compiled Legislative Histories. Researchers should begin their U.S. federal legislative history research with this finding aid, which often includes references to law review articles on-point to a particular legislative history.

9. **U. S. Attorney General Opinions**

This collection includes the official opinions of the U.S. Attorney General (both the Official
Opinions of the Attorneys General of the United States, as well as the Opinions of the Office of Legal Counsel of the United States Department of Justice).

10. United States Code
This collection includes complete coverage of the United States Code dating back to inception in 1925-1926. Also includes the Early Federal Laws Collection, which represents the most complete collection of federal statute compilations prior to the US Code.

11. Treaties and Agreement Library
This library includes all U.S. treaties, whether currently in-force, expired, or not-yet officially published. This is the world's largest and most complete online collection of U.S. treaties and agreements and includes such prominent collections as the United States Treaties and Other International Agreements set (commonly referred to as the "Blue set"), as well as famous sets from Bevans, Miller, Malloy and others. These include many documents of the U.S. Department of State under treaty series, treaties and international act series.

12. Pentagon Papers (New)
The collection is officially titled United States Vietnam Relations, 19451967: A Study. Prepared by the Department of Defense, these "Pentagon Papers" are a history of the United States' political-military involvement in Vietnam from 1945 to 1967.

The Federal Register is updated on a daily basis. It's coverage is comprehensive and begins from inception (1936). Also includes the CFR from inception (1938), United States Government Manual from inception (1935), Daily and Weekly Compilation of Presidential Documents from inception (1965).

Coverage is comprehensive, containing more than 8,500 volumes dating back to inception (1938).

15. Canada Supreme Court Reports
This covers from 1876 to 2010.

16. Law Journal Library
This database contains more than 1,620 law and law-related periodicals. Coverage is from the first issue published for all periodicals and goes through the most-currently published issues allowed based on contracts with publishers. Search by article title, author, subject, state or country published, full text, and narrow by date. Browse by the following criteria---publication title, State (U.S.), country, subject, and most cited can be possible.

Westlaw India
This electronic resource is produced by the Thompson Reuters (Legal) Ltd. The publisher is proving the collection in two formats, viz., i) The Westlaw UK for global customers, and ii) The Westlaw India customized database for Indian customers. While the Westlaw India provides a comprehensive coverage of cases and legislations pertaining to India, this collection also provides access to UK Materials and EU materials. UK Materials can further be categorized into United Kingdom cases, legislations, journals and current awareness; where there is a separate source on European Union materials. In addition to comprehensive Indian and UK
law libraries, Westlaw India offers a selection of United States and Commonwealth law libraries, US Federal Primary Law, U.S. Law Reviews and Journals, Australian Case Law, Canadian Primary Law, among others. Its international materials section includes publications from different jurisdictions, i.e., the United States, United Kingdom, European Union, Australia, New Zealand, Canada and Hong Kong.

As mentioned earlier, Case reports and Legislations are two of the primary sources of legal information. If we see the database architecture of Westlaw India, we would found that resources are broadly categorized under Cases and Legislations. For Indian cases, databases on Supreme Court Judgments, Supreme Court Orders, Federal Court Judgments and Tribunals are available. Under Supreme Court Judgments and Federal Court Judgments documents are further categorized as Case Analysis Documents and Full-Text Judgments. Online version of many law reports and journals are made available under this Case Analysis Documents category. Though, mostly, their full archive collections are not ready in web version as yet. The Full Text Judgments part gives detailed case reports of Supreme Court Cases from 1950 onwards. The Federal Court Judgments give full-text case reports from 1938-1950. The High Court Judgments section gives case reports from all 20 High Courts. The Tribunals database covers various Tribunals', Commissions' reports and Boards' decisions. The Legislations section holds a collection of Central Legislations from the eras of colonial rule to current year. The Subordinate Legislation database holds Rules & Regulations, Bills (before the ParliamentLok Sabha and Rajya Sabha), Ordinances, Notifications and Circulars. The State Legislation section presently covers only the states of Andhra Pradesh, Delhi, Gujarat, Haryana, Karnataka, Maharashtra, Orissa, Punjab, Tamil Nadu, Uttar Pradesh, and West Bengal. Westlaw India also covers major legal news, mainly from cases coming before the Supreme Court and various High Courts.

The UK Materials section also covers Cases, Legislations, Journals and UK current awareness. UK Cases are further grouped under Case Analysis Documents and Law Reports and Transcripts, both providing alphabetical lists. The UK Legislation section covers Public & General Acts, Local Acts, Statutory Instruments, Statutory Rules & Orders, Church Assembly and General Synod Measures for different jurisdictions, i.e., UK, Scotland, Wales and Northern Ireland. UK Journals collection contains both Abstracted Articles and Publication Indexed databases, as well as Full-Text Articles. Two of the indexing databases which are covered under the Abstracted Articles are Legal Journals Index (LJI) and Financial Journals Index Archive (FJI). The Full-Text Articles contains alphabetical list of journal holdings. On selecting a particular journal, one can browse the archive and locate the desired document (article).Documents in HTML format can be saved either in WordPerfect (RTF) or in PDF. There is option for attaching documents in e-mail also.

The EU Materials collection covers Cases, Legislation, Treaties, Preparatory Acts, Information and Notices. The Cases section covers cases from Court of Justice, General Court, Civil Service Tribunal and EFTA Court which can be browsed either by judgment date or by court name. The Court of Justice covers cases from 1954 onwards, while General Court covers 1980 onwards. The EFTA Court covers 1994 onwards, while Civil Service Tribunal covers cases since 2000 A.D. The Legislation section gives statutory information from 1952, while the Preparatory Acts section covers since 1958. One can browse through alphabetical topical terms list under each year. The Treaties collection holds information under these sub-collections—Founding Treaty, Accession Treaties, and Other Treaties and Protocols, all of these browsable.

From the home page of Westlaw India, International Materials is linked, whereby Westlaw.UK window opens. Access permission is not granted to NUJS Library to search these resources under the present subscription agreement.
So, it is quite evident that these three e-resources try to incorporate several sources of legal information both from common law system and civil law system. Now, if we think about the possible bibliographic management of at least part of these e-resources, keeping in view the primary sources of legal information discussed above, this would be of utmost value to legal researchers in general and the library's patrons in particular. It is observed that case reporters are the starting point of any legal research, though constitutions and legislations have their own merits among the primary sources. In legal information systems, law reviews and legal periodicals are considered as secondary sources.

Bibliographic Management of Electronic Resources at NUJS: The NUJS L&IC presently does not use any ERM System from any commercial database vendor. In absence of any such system, it is but natural for any library to start with its web-portal as the starting point for resource discovery for its patron community. Presently, the library website (http://www.wix.com/nujskol/nujs-library) provides links to all the e-resources subscribed by the library, as well as open source information resources in the field of law and other social sciences. However, the distinct architecture for each of these resource databases cannot be explored by a researcher without proper meta-data. In a study, Digby, Todd (2004) has analyzed the need for describing online journals and their sources in hybrid index/full-text databases, monographic texts, case law vs. statutory materials for a law school's library web page [8]. Alphabetical listing of periodicals, subject-wise classification of e-resources and publisher wise (Government vs. commercial) for legal information) listing online resource materials are established tradition for integrating metadata about subscribed e-resources in library portal. Some categorization of legal e-resources as descriptive materials and practice oriented titles (e.g., form books, jury instructions, legal checklists, etc.) are mentioned in some studies, which can further be divided by jurisdiction. In the area of law, common distinctions include domestic vs. foreign vs. international sources, and standard LC schedule topics [9].

Keeping all these in mind, the present study wants to propose some way of resource description for these electronic databases. The author has primarily identified the Legal Classics, English Reports, U. S. Supreme Court Library and Law Journal Library from Hein Online for listing into the library portal of NUJS Library & Information Centre. From Westlaw India, Case Analysis Documents for India, as well as U.K., Law Reports and Transcripts for U.K., and U. K. Journals< Full Text Articles have been identified. The above mentioned resources are either monographic texts, or case reporters or full text journal collections.

Conclusion

ERM is an increasingly complex challenge before the LIS professionals. The ultimate goal is to deliver the resource information to the end user effectively and in a most efficient way. For aggregator databases, the task before the electronic resource librarian is to routinely monitor which journals they provide— for what period of time, in what format, and with what degree of currency and the union listing should be updated accordingly in the library web-site. To optimize the use of e-resources, certain kind of instructional information also needs to be incorporated into the library portal.

Financial Management
Fund Raising Strategies for College Libraries in West Bengal: need of the time

Avijit Chakrabarti¹ and Pritam Gurey²

¹Barasat College, Kolkata-126
E-mail: avijit.chakrabarti@yahoo.com
²Vidyasagar College for Women, Kolkata
E-mail: pritam.vb@gmail.com

Abstract: Fundraising is the process of soliciting and gathering contribution as money for non-profit organizations by requesting donations from individuals, businesses, charitable foundations or governmental agencies. Traditionally, fundraising consisted mostly of asking for donations on the street or at people's doors. Today, fundraising may be done face to face or by online requests. Colleges in West Bengal received funds mainly from government agencies like University Grant Commission (UGC), Higher Education Department and contribution from students. But with instability in economy Governmental budgets can vary from each year due to cutbacks, lower governmental tax revenues etc. So, college libraries have to plan accordingly to generate funds to purchase items and maintain the quality of service. The money that is generated through fundraising will provide more resources for library to purchase equipment, supplies and inventories. There are several strategies to raise fund for academic libraries such as Read-a-Thon, Write-a-thon, Book festival, Inventory sales, Cultural contest, Help from Alumni etc. The aim of the paper is to discuss the present condition of fund raising activities by the college libraries in West Bengal. The paper is also suggests new strategies to raise fund without hampering any law and regulation by Government of West Bengal and UGC.

Key words: Fund Raising, College Libraries,

1. Introduction

Education is a process of learning, with the aim to develop the capabilities in the people at all levels. In this process schools, colleges and universities play a vital role. The present educational system in India comprises both academic and professional studies by offering courses leading to bachelor's and master's degrees. This system has evolved over the last 150 years. It was initiated by the British rulers of the country and after 1947 it was developed by independent India with appropriate changes and modifications. In the last fifty years, the educational system has been reviewed by high powered commissions set up by the Government of India at different times, in order to introduce appropriate measures to improve the quality of education and make it more relevant to the country's requirements. In recent years, the government has been very much concerned with educational reforms. The nation adopted a new educational policy in 1986 in order to provide the best education to our children, wherein we are in tune with our national heritage as well as modern with advances in science, technology and management. In all these efforts to modernize our educational system, libraries and self-learning have been considered vital components and integral parts of the entire educational process. Considerable thought and attention have been given to the planning and development of academic libraries and self-learning at all levels. A library is created with the intention of providing access to reading materials, with the
altruistic goal of educational enlightenment and the better welfare of the society. Finance is essential to run a library effectively and efficiently. Every type of library has its financial resources. It may be grant, donation, membership fee etc. But unfortunately, according to UNESCO, India has the lowest public expenditure on higher education per student in the world. So, we must look to build our own library fund by various fund raising activities.

2. College Library

College performs an important function in the educational process. College education provides a totally different environment for boys and girls who go for higher studies. Usually the classes comprise a large number of students and unlike school education, the students of college get much less individual attention from the teachers. The students, therefore, have to end much more on self-learning. Therefore, the college library is the automatic choice for students to supplement their class room teaching. A good and efficient library will certainly help students to meet the new challenges they start facing at college: They can, within the four walls of the library, use their leisure more usefully and meaningfully, discover their own inherent potentialities, launch upon instructive and absorbing hobbies and generally lay the foundations of a good and more responsible life in the future. The libraries will therefore become equally, if not more, important than the classrooms. The libraries will become students' workshops. It is in this context that a college library has to play a very responsible role, vis-à-vis, the academic needs of young students.

2.1 Key components of college library:

The key components of college library are

- a collection of books and other learning and teaching material;
- the user community, comprising students, teachers, the college management and others getting standard library services;
- physical facilities like building, furniture, equipment;
- professional staff of the library;
- the college management; finance and budget.

2.2 Services of college library:

Important college library services are

- Text book services;
- Lending and inter library loan service; in) Reading room services;
- Information and Reference;
- Display of current additions or production of lists of current accessions; vi) Documentation services, only on specific request, should include:
- Current awareness to literature, special journals. Preparation of current lists of reference, Indexing/Abstracting services on projects, etc.
- Reprographic services;
- Audio-visual services such as film shows, tape-slide demonstrations; etc.;
- Exhibitions and special display; and
- Assistance in the use of the library.
2.3 Finance:

College libraries are not revenue earning institutions. Most of them are service components of academic and other institutional bodies. Hence they have a special obligation to manage their finances with great care and judiciousness. The importance of the provision of a continuous flow of adequate finance to libraries cannot be exaggerated. A few principles, however, are required to be kept in view, as finance is also an instrument of control and evaluation. With the increasing costs of books and journal subscriptions, it would be impossible to plan a collection development programme, consistent with the needs of users, without an ensured supply of funds. While appropriations are made for the acquisition of books and journals, funding bodies quite often overlook or underestimate the necessity of funds for processing the acquired materials and making them available for use.

2.3.1 Nature of Finance: College libraries are not always growing. But while established it require permanent or recurring funds for its maintenance of staff, books and building for its minimum requirements regularly. But on the other hand all such expenditure which are required for opening new services, equipments, new staff, building extension etc. are met by non-recurring or development grant. These funds are provided for a particular purpose. Such funds can not be utilized for other purpose, for which they are not given. So, there are two types of finance

- Finance is needed for development aspect of the library
- Finance is needed for regular requirements of the library

2.3.2 Sources of Fund: The sources of funds for college libraries can be broadly grouped as follows:

- Regular grants from University Grants Commission (UGC): The University Grants Commission gives more importance to the college libraries. As the quality of higher education and research, especially at the graduate level, depends upon, among other things, the standard of the college libraries and their services. Therefore, the UGC has played a significant role in the growth and development of college libraries since 1953 by giving grants for books, equipment, staff and library buildings and has done a remarkable job in salary improvement of the college librarians. The UGC's contribution to the college libraries is at the rate of Rs. 15 per student with a maximum of Rs.10,000 with some additional and special grants for text books, when a new subject is introduced in the Curriculum (Vyas, 1974). A large number of college libraries throughout our country receive grants from the University Grants Commission.

- Ad hoc grants from Department of Higher Education, Government of West Bengal: The Department of Higher Education, Government of West Bengal sometime issue ad hoc grant for purchase of books and equipments for college library. But this type of grant is irregular.

- Grants from endowments: A financial endowment is a transfer of money or property donated to an institution. The total value of an institution's investments is often referred to as the institution's endowment and is typically organized as a public charity, private foundation, or trust. In West Bengal, there are some colleges run by the Trust and Private Foundation. So, libraries of those colleges may get some grants from their parent bodies.

- Membership Fees: Library membership fee is an important source of revenue when a member is involved in a library, he/ she has to pay a library membership fee which is
non-refundable. This type of fee is included in the library budget as library income. However, it is not sufficient to meet the whole requirement of the library by membership fee. In West Bengal, college library fee has been given less importance and levied at nominal rates. But in European countries library fee is charged at higher rates in the name of subscription fee.

- **Fines**: Every library makes efforts to get the books returned from the members in time. But there are few members which are habitual not to return books in time or on due date. This habit creates indiscipline in the library and increase dissatisfaction among the readers who failed to receive their desired books. Some libraries have framed necessary rules to prevent this decrease and some libraries impose fines on the late return of books as well as for loss or misuse of books. Income from this source is very meager. As a matter of fact, it cannot be considered as a source of income, because the aim of the fine is not to raise revenue but to compel the user to return the borrowed book in time and not to damage or lose it during his/her possession. Moreover, libraries may not have the authority to re-appropriate amount collected as fine or overdue charges for any purpose.

- **Library Discount**: It is a tradition in Indian libraries to charge library discount on the cost of books. Library discount in college libraries is based on tender procedure and librarian call quotations for library discount. However, library discount may or may not be considered as revenue of a library.

- **Miscellaneous sources**: Miscellaneous sources may consist of money received by the sale of library publications and waste paper, reprographic services, translation and other documentation services rendered, etc. These services are rendered by libraries usually on a non-profit basis. Normally, such (limited) funds are added to the general fund of the college for allocation through normal budgeting.

### 2.4 Recommendations:

While the Radhakrishnan Commission recommended the setting apart of six per cent of the total college budget for the development of their respective libraries, the Kothari Commission raised it to about ten per cent. The Karnataka State Universities Review Committee (popularly known as the Raj Commission, as Prof. K.N. Raj headed this Commission) went a step further and recommended the setting apart of 20 per cent of the college budget for the maintenance and development of the library. It is a genuine and necessary requirement. Allocation of adequate funds, as recommended by the Raj Commission, is necessary for building a responsive service and for operating the library at the research and teaching level. The total expenditure on the college libraries according to the recommendation of the Education Commission should be 6.25 per cent of the total budgets of the colleges, but in most cases it has remained between 1.5 per cent and 2.3 per cent (Sardana). Collection development of the college libraries are done without taking into consideration the actual needs of the faculty and the students of the colleges as sixty per cent of them consist of text books and 20 per cent cover fiction (Reddy, 1974).

### 2.5 Present scenario in West Bengal:

The foregoing account has given a pen picture of what a good, healthy and efficient college library should be. But the actual situation in India is not upto the mark. In spite of substantial financial aid from the University Grants Commission, several college libraries, still continue to wear a low profile. Colleges shall have to generate funds through substantive library fee in order to provide students proper academic nourishment. The shortcomings of these neglected libraries are inadequate book collections, inhospitable buildings, and faculty
functioning, leaving much to be desired. The situation should improve if the aims and objectives of college education have to be achieved.

3. Fund Raising

Fundraising is the process of soliciting and gathering contribution as money for non-profit organizations by requesting donations from individuals, businesses, charitable foundations or governmental agencies. Traditionally, fundraising consisted mostly of asking for donations on the street or at people's doors. Today, fundraising may be done face to face or by online requests. Colleges in West Bengal received funds mainly from government agencies like University Grants Commission (UGC), Higher Education Department and contribution from students. But with instability in economy Governmental budgets can vary from each year due to cutbacks, lower governmental tax revenues etc. So, college libraries have to plan accordingly to generate funds to purchase items and maintain the quality of service. The money that is generated through fundraising will provide more resources for library to purchase equipment, supplies and inventories. In West Bengal, college libraries do not organize any fund raising activities at all. There are several strategies to raise fund for academic libraries such as Read-a-Thon, Write-a-thon, Book festival, Inventory sales, Cultural contest, Help from Alumni etc.

3.1 Read-a-Thon:

Members of the college library sign-up to participate in this type of fundraiser. They then ask relatives, friends, and neighbors to make a pledge donation to help a certain "cause" - i.e. purchase new reference books or upgrade computers. Pledge amounts can be calculated either by the number of books read in a specified period (i.e. 60 days), or contributors can also choose to donate a fixed amount. Another variation of a read-a-thon is an event called "Born to Read". This program reaches out to parents and students to teach them to love books. Sessions are held in the library to show parents how much fun reading can be and encourage them to read with their children. The program can be funded through donations or small admission fees for the sessions. Libraries can reach out to publishers to ask for a small donation of new book the publisher is trying to promote. This book can be given to each attendee as a small gift, which basically covers their admission fee.

3.2 Write-a-Thon:

Libraries are no longer places just for finding great books, magazines, music, DVDs, and information online, they've become places to create as well. With this in mind, why not host a write-a-thon? Participants can research, become inspired, meet other writers, and work on their projects all at the same time. A successful write-a-thon event brings in teachers, poets, and even instructors to help lead activities throughout the day. Write-a-thons are a great way to highlight the library and build user community.

3.3 Book festival:

Since a library is a central hub for many students to gather and spend time, hosting an event is an excellent library fundraising idea. Consider an event that strengthens the mission of the library. A few months prior to the event, collect books as donations. Recruit volunteers to help organize the book displays the day of the event, and sell books for a low price. Librarians may also want to consider making the event even more appealing by adding refreshments and entertainment. Reach out to a local artist or band to see if they would be interested in performing during the event or bring in an author of a newly released best-selling novel to attend the event for a book signing. Reach out to local restaurants to see if
they would be interested in attending the event and offering free sampling or food and beverage sales.

3.4 Book Exhibition:
Librarian may appeal to Publishers to organize a book exhibition for the students where they can also sell book to them. But they have give some token money to organize and use the space inside the library. If possible they can also provide some sample copy of newly released or newly edited books as specimen copy to the library.

3.5 Inventory Sale:
Clear out old inventory and make money for the library in the process. Sell old books (outdated or out of syllabus), magazines, audio cassettes, video cassettes, DVDs, CDs and other materials. In this regard librarian has to remember that only those materials can be sold out which was purchased by college fund. They have to take permission from UGC before selling of books purchased by UGC fund. Old furniture, computers, printers, video projectors and other equipment can also be sold. Hold the fundraiser on a Saturday, so more people will be able to attend.

3.6 Literature Festival:
Bring in local and national authors to serve as guest speakers for literature festival. The authors can also read portions of their books and discuss the inspiration behind their writing. Organize workshops that are centered on books and the publishing industry. Titles for the workshops can include "Writing Your First Book," "Breaking Into the Publishing World" and "How to Self-Publish Your Book." Bring in clowns, jugglers and other performers to attract students with their parents. Money can be generated from admission fees.

3.7 Cultural Contest:
Accept short story submissions from the students. Charge each student who submits a short story as participation fee. Give the writers a central theme to include in their short stories, such as courage, peace or appreciation, or let them write freely. Announce the winners during a reception and awards ceremony at the library. Award the winners cash prizes and trophies. Charge the parents and other public an admission fee to attend the ceremony.

3.8 Help from alumni:
“A friend is a friend in the time of need”- Alumni always an option from where college can generate fund. Create some awareness among alumni members regarding need of the library and allow them to help with appreciation.

4. Conclusion
As college libraries in West Bengal financially depend on UGC and state government mainly, it is quite difficult to implement fund raising activities which violet the rules and regulations of those government agencies. That is why librarians first need to prepare a policy or guideline for fund raising activities with legal consultation. Government should also understand the need of fund raising in this time of global economic crisis. It is not possible for Government to fulfill the entire requirement of the college libraries as and when required. Probably, in near future college librarians may adopt the above mentioned fund raising strategies to improve the condition of their libraries.

Abstract: This article indicates the various financial problems associated with the college library budget. It studies the meaning of budget and examines the various techniques of budgeting that may be use in the libraries for fund acquisition and allocation. It draws the necessary steps to be taken for library budget preparation and finally concluded with the role of librarian for better utilization of limited fund.

Keywords: Fund crisis, Budget planning, Library budget, Fund allocation, Library finance

1. Introduction

Libraries have to play central role in the lives of colleges in supporting teaching-learning process. Development of collection of such library is very vital for the users and it is the responsibility to the academic librarians to provide the required literature and information to the students, faculties and non-academic staff of the college where they worked. It is experienced that the allotment of fund for library is not increases proportionately and most of the college libraries in Kolkata are passing in the time of financial constraints.

This financial crisis resists the development of modern library services. At this stage, college librarians have to face the challenges to provide library services with limited amount of fund. The first challenge to the librarian is the power to prepare library budget. Most the colleges prepared their library budget without any consultancy with the librarian except few cases. Fund to be utilized in any financial year for the library purpose was decided by the College Authority. Rising cost of materials is the second challenge to the librarian. Cost of books, periodicals, audio-visual materials increases day by day and inflation rate is also high. So allocation of fund at the fixed rate is creating difficulties to the librarian to acquire the required documents for library.

Again increasing number of title published in the market on different disciplines taught in the Colleges and unpredictability of the funding is another probable problem to the librarian. Which title should we purchase? Whether the additional copy for the existing title will acquire or nor? are the common questions the librarians have to face. Some time it is found that disbursement of fund made on the opinion of the college authority and the librarian have to utilize the fund within very short period which leads to acquisition of unusable titles. Distribution of allotted fund to the various departments is also another challenge to the librarian. What amount to be allotted to which department in each subject? What should be the ratio? The development of a satisfactory distribution of book funds among departments is actually a rather complicated matter. A crucial problem relates to whether the funds
allotted for the purchase of new books for the several departments shall be considered a part of the departmental budget or a part of the library budget. A balance distribution of fund is most challenging to the college librarian. Sometimes it is found that already allotted funds may be claimed back by the administrator. Technological advances are creating a number of problems and challenges with respect of resources collection and library services. New types of services have been created making older ones obsolete. Slowly and steadily library moves from print resources to e-resources, as a result, library required more and more fund to provide the new emergent library services.

2. Financial aspects of library finance

The development and execution of the library budget is one of the most important tasks of the librarian. The process should be integrated with the planning and evaluation of library services. Once the prepared budget reviewed and approved by the Authority, the budget serves as a roadmap for the delivery of library services in the subsequent year.

2.1. What is budget? The word budget derived from the French word bougette which means purse. A budget is a statement of financial plan which shows the estimated revenues and expenditures. A budget can be made for a person, family, group of people, business, government, country, multinational organization or just about anything else that makes and spends money.

2.2. Why budget? The budget provides information about how much money needed to carry out library activities. It forces to be rigorous in thinking through the implications of library activity planning. There are times when the realities of the budgeting process force librarian to rethink about action plans. Proper used of the budget tells when organization will need certain amounts of money to carry out its activities. The budget enables to monitor income and expenditure and identify the related problems, if any. It is the basis for financial accountability and transparency. When everyone can see how much should have been spent and received, they can ask informed questions about discrepancies. Expectation for more funds cannot possible unless a planned budget is there as it is a basis for deciding whether the additional requisition is reasonable and well-planned.

2.3 What are the budget revenues? The budget revenues means the sources of fund that may be utilized for the development of library in term of library materials, man power, services etc. The main sources of fund for college libraries include grants from various agencies such as University Grants Commission, State Government etc. A library fee from the students is another source of fund. Fines, disposal of library materials, fees for reprography and printing service etc. are also generate fund for the library.

2.4. What are the budget expenditures? The budget expenditures include the expenses for library documents (such as books, periodicals, A/V materials), library furniture, fixture and equipment, repairing/erection of library building etc.

2.5. How estimated fund requirement be calculate? There are three different methods to estimate the library fund requirement. Under per capita method, a minimum amount per user of the library is fixed as library budget. In proportionate method, a certain proportion of the total college budget allotted to the library as library budget and method of details find out the financial requirements of a library based on the details of expenditure required for the budget period.

Although not trained as accountants, librarians rely on accounting information for strategic planning and operational decision making. Increased demands for institutional accountability, with university performance, and costs under increased scrutiny, place
librarians under increased pressure to maintain quality services, while faced with decreased funding and tighter budgets.

3. Budgeting techniques for financial planning

Budgeting refers to a course of action based upon an estimate of assumed income and expenses. It is simply a term defined as a plan of operation where one reviews their income and expenditures, often in the effort to create a strategy in order to achieve some financial goal or goals within a specific period of time. There are numerous budgeting techniques found in practice. Some of them are often used in the library. These are:

3.1. Line-item budgeting: Line-item budgeting is probably the most common budgeting system. It makes all increases and decreases to the budget equal for all units on a percentile basis. Basically, there is a line for every type of expenditure e.g. library materials, electricity, travel, and a numbering system to keep track of them. The great problem with line-item budgeting is that they don’t show the true costs of services or programs, which are comprised of several line items. And the individual line items each support several programs. Line item budgeting is very easy to cut with no real accountability for the consequences.

3.2. Incremental budgeting: Incremental budgeting use the figures of the actual expenditure for the previous year with a percentage added for an inflationary increase for the next year. This is an easy method that saves time but it is the “lazy” way and is often inaccurate. This budgeting technique is only suitable for organizations where each year is very similar to the previous one in terms of activities. Very few dynamic organizations or projects are so stable that this budgeting technique really works for them.

3.3. Formula budgeting: Formula budgeting is typically used by the government bodies as a means of distributing its money to its sub units. A formula is essentially asset of pre-defined rules accepted by the authority. When formula budgeting is used in a particular institution, different formulas are used for different units. For example, the library and physics lab would probably have different formulas for budgeting as part of the college. Some of the factors that are consider for formula budgeting are number students users, space coverage, number of services provided etc. The advantage of formula budgeting is that it is easy to predict the fund require for a particular unit. But this system of budgeting does not consider the new programmes or innovative practices.

3.4. Performance budgeting: Performance budget aims to evaluate performance of various responsibility units. This method measures the quantity of performed activities. For example, data on the number of books acquired, classified and catalogued, actual man hours work for circulation service etc. The quality of performance of the activities is very difficult to measure in terms of money costs. Careful accumulation of data over a certain period of time is essential to this approach. It requires cost-benefit analysis to established priorities. Costs are presented in term of work to be accomplished, so that the emphasis is on cost at the expense of service. The great difficulty of performance budgeting is to classify all operations into functions, programmes and activities.

3.5. Programme budgeting: Programme budgeting is the short form for Planning, Programming and Budgeting System (PPBS). This is a budgetary process meant for making operation more effective and efficient, through improved allocation of resources. It aims at optimum utilization of available scarce resources so that maximum benefit can be derived. Budgets are prepared for the different programmes of the library such as administrative services, technical services, readers’ services, reference services etc. Cost-benefit analysis is carried out for each programme so that most favourable can be selected out of alternative sub-programmes. PPBS is mainly used in non-profit organizations to enable them to make
more improved decisions about resources allocation. For example, if an academic library system is planning a 'Request an Article' service for their users, then the cost of the service in term of staffing, materials documents is calculated and presented.

3.6. **Zero-Based Budgeting:** Zero-base budgeting is a modern management tool for planning and controlling expenditure. ZBB critically reviews and questions justification for the previous year's activities and spending and in such a way starts planning from Zero-base and therefore, it is termed as Zero-base budgeting. It is based on not what happened in the pervious year but rather on future requirements. It was developed by P.A. Pyhrr in 1970 and used by him in Texas Instruments Corporation of USA as a manager of Personnel Control Department. Under ZBB, there is a continuous re-evaluation of the activities of the organization to ascertain that activities are absolutely necessary for the organization. Activities which are of no value or less essential find no place in the forthcoming budget. ZBB affords a choice amongst the alternatives so that activities would be selected in order of their importance. It facilitates identification of inefficient and unnecessary activities to avoid wasteful expenditure of the library. Librarians must first identify the priorities and justify their costs. ZBB works as follows

- The work in the library is broken up into units; e.g. circulation, journals, books, etc
- Priorities of units are established based on goals and objectives of the organization
- Cost of operating each unit is worked out
- Each unit then ranked in priority order and presented for approval or rejection
- Finally approved or rejected based on affordability.

3.7. **Activity-based budgeting:** The idea behind this model is the cost transparency and effective cost management. It is a logical approach to the management of the organization, which helps to learn to assess the organization's process and to identify their cost. There is no holding cost inside the organization, there are only activities carried out for customer services which in turn lead to charges.

3.8. **Multi-year budgeting:** Multi-year budgeting is nothing but the budgeting for more than one year. There are opportunities in the course of the two years to make needed adjustments, but basically this type of budgeting is seen as a useful planning tool. Indeed, proposing a new library programme and estimating what it is going to cost and perhaps save in Year 1 and Year 2 can be a very helpful in persuading funding authorities to adopt it. The problem with multi-year budgeting is the surprise decline in revenues or the inability to respond flexibly when a new problem emerges that a library programme might mitigate.

4. **Budget Planning**

Budgeting means the act of drawing or preparing budget in a concern for a fixed future period. It is the task or functions of drawing up statements in planning for estimated revenues and corresponding expenses of a concern for a fixed future period. It is not a day or two or by mere oral discussion, but is a continuous job. The library has endeavored to maintain a balance, effecting budget for collections and services as well as to positions, and to make choices that offer the prospect of rebuilding recognized areas of strength once the financial conditions improve. Before going to prepare the library budget, a librarian must:

- Understand the values, strategy and plans of the library
- Understand what it means to be cost effective and cost efficient and
- Understand what is involved in generation and rising funds
5. Budget planning factors

The preparation of budget and implementation of budgetary control in a modern library requires an effective budget programme with the help of a sound and efficient organization. The following are the principal budget planning factors generally considered for the better functioning of budget organization.

5.1. Budget period: A budget period is a period of time for which the budget is prepared and operated. There is no hard and fast rule for the selection of budget period. The budget period may be (i) short term- a period of one year or less, (ii) medium term- two or three year period, and (iii) long term- more than five year period. Generally long term budget is prepared for construction of library building. Medium term budget is generally preparing for purchase of stacks, furniture etc. and short term budget for acquisition of books, journal, annual maintenance charges etc.

5.2. Budget committee: Budget committee is a committee formed with few members for formulation of a general programme for preparing budget and for exercising overall control over implementation of the budget. A budget committee will provide guidelines for preparation of functional budgets evaluate and revise the estimates before preparing the final budget and prepare master budget.

5.3. Budget manual: A budget manual is a written document, book-let or schedules indicating the policy of the budget, objectives of budget organization, procedures to be followed in budgeting, forms to be used and the responsibilities to be created at different levels. A budget manual provides the rules and instructions for budgeting, routine and procedures and all other affairs regarding budgetary control. So a budget manual indicates what to do, how to do, when to do and in which form to do.

5.4. Budget centre: The budget centre is a section of the organization for the responsibility of executing the budget will be fixed. Library is to be treated as a cost centre of the college. The main objective of setting up budget centre is to judge whether costs are controlled at the point of occurrence or not.

5.5. Organization chart: An organization chart is chart used in budgeting and budgetary control showing the authority and responsibilities of each members of the budget committee with the other members in the committee. So an organization chart shows the scope of authority and responsibility of the members and their inter-relationship at a glance.

5.6. Limiting factor: Limiting factor or key factor in budgeting is that factor which influences directly to the preparation of a functional budget and extent of whose influence must be assessed first of all. There may have only one or more limiting factor for the library budget. The limiting factors are to be identified and diagnosed carefully at the time of budgeting because the budget will be meaningless or purposeless unless these are not considered in depth. The fund, space, library staff etc. are the some limiting factors which should be consider at the time of preparation of library budget.

6. Budgeting planning procedure

Budgeting is not a single task. A proper procedure should be followed for ensuring a useful budget. Preparation of budget requires a systematic process consisting of a number of sequential steps. If these steps are not followed systematically one after another the budget will not be proper and accurate. The following are the different steps to be followed for preparation of budget of a modern library:

- Identification of the key aims for the budget period
Financial Management

- Identification of any major external changes likely to affect the library
- Determination of principal budget factor or limiting factor
- Initial preparation of the functional budget
- Review and co-ordination of the subsidiary budgets by the Budget Committee
- Consolidation of individual functional budget into a single Master Budget
- The Master Budget is to be presented to the College Authority for approval, if approved, the budgets are finalized
- Otherwise revised the budgets

The budget planning cycle should look like this:

![Budget Planning Cycle](image)

5. Librarian’s role under fund crisis

The digital revolution boosts the library user’s demand for accessing the wide range of library services at 24/7. Again social, economic, educational and technological developments including the growth of social networking, virtual learning and research environments change the traditional library services. Librarians have to face the kinds of financial pressures to outline the above, they have to ensure to providing the high levels of services and continue to same. Librarians have to perform a leading role for the preparation of library budget and implementation which are as follows:

7.1 Fund acquisition: Librarian should know the sources of fund for library. Internal sources of fund includes college’s own grant, photocopying fees, fines for late returns of library documents, sales of old periodicals, movie shows etc. and external sources includes various grants from the external agencies, donations etc.

7.2 Budget preparation: Librarian should embrace the principle of decentralized budgeting. Departmental heads and subject experts would then be involved in preparing and managing library budgets. This will enhance managerial skills and democratize fiscal management resulting in more transparency and accountability in the library’s financial
dealings. The budget format should reflect the categories and items that are decided for
estimation for the library and must allow for sub-totals and for a total expenditure. Librarian
should cultivate the culture of budgeting. Some form of financial management system should
be used for the library. No matter how small the resources allotted, a plan must be made and/or
implemented.

**7.3 Fund allocation:** Proper allocation is essential for better utilization of fund. The
collections found deficit would be given high priority in the form of a need based assessment
for departmental allocation of fund.

**7.4 Documents acquisition:** Librarian should monitor the selection and acquisition of print
and electronic resources for the library so that the acquired documents should be highly usable
and the fund utilized properly.

**7.5 Allocation control:** Budgets are prepared in advance and there is likely to be price
increases between the time of preparation and the time when the amount is spent. A handsome
consideration should be made at the time of budget estimation. Budget monitoring is required
to measure how closely the library is meeting its objectives in terms of its finance. A variance
report is to be prepared to compare the actual revenues and expenditure against the budgeted
amount for the budgetary control purpose.

**7.6 Long term planning:** Long term planning for the library includes extension of library
building, acquisition of new furniture and fixtures, purchase of new racks and almirahs etc.
Librarian should take active role for the designing of the library layout.

**7.7 Value creation:** Fostering an environment in which students and others can make
effective use of library holdings as well as resources held by other institutions.

**7.8 New services:** Finally the librarian has to create the facilities to access the electronic
subject information with the help of information communication technology. The cost of
introducing new library services should be cost effective and long term benefit should be
available from there.

**8. Conclusion**

If the budget has been grooming carefully and steadily with the needs of the library, it will
be found that some budgets do not need to be expanded nearly as high. Gather as much
information as possible to build budget requests; this is especially important in view of the
financial crises we are all facing. Statement supporting budgets must be precise and sensitive
to change yet make able to provide continuity.

Again what it means in practiced terms is that librarians will have to become familiar with
the concepts and techniques employed in economic planning and some will head to
become much more familiar with the educational, social and technological needs of the
member served.

Finally management of libraries requires an awareness of the political context in which
they operates. It was thought that the fate of libraries and the quality of library services was
more affected by extraneous factors such as the authority's attitude, personal grievance,
students' militancy etc. than by the library staff.

Users' Management
Psychiatrists as Users: the West Bengal Scenario

Susmita Chakraborty¹ and Dr. Chaitali Dutta²

¹Bengal Engineering and Science University, Shibpur, Howrah
E-mail: susmitachakraborty94@gmail.com
²West Bengal Board of Secondary Education
Government of West Bengal

Abstract: Library is a knowledge organization where a team of professional, semi-professional and non-professional employees strive to serve a common purpose, namely, to cater to their clientele in the best possible way. So, the user study issue continues to hold an important niche in the LIS arena. The libraries have undergone a paradigm shift in many respects: from micro to macro information, change in the format of resources, the entrance of upcoming technologies to cause radical shift in the dimensions of information storage and retrieval. These and many other factors have contributed to the growth of Digital Era Librarianship.

As Mahatma Gandhi has taught us, customers (users) are our God; we should serve them in the best possible way and without wasting their valuable time. This dictum leads us towards learning the needs of our users, learning the loop holes in our service sector, taking up feedbacks in all contact points, and to try to bridge the gap between demand and delivery.

With this end in view, this paper studies how the psychiatrists seek information, what are their chosen points of query, what are the service points they are using or non-using, what types of resources are found popular to them, the channels that they are finding useful, among others.

Different aspects of user needs in the domain of the psychiatry came under the microscope here. Our goal and mission is to enter into the ultimate user-centred LIS universe under the dynamic leadership of the digital librarian. To achieve that goal in a more effective way, this paper thus tries to present some recommendations also.

Keywords: User Study, Psychiatrists, West Bengal, User-centred Management, Information Needs, Digital Era, Information Use

Terminological Clarifications

Psychiatry:

The term psychiatry, derived from Greek roots meaning ‘mind healing’, refers to the medical science that deals with the study, diagnosis, treatment, and prevention of mental disorders. These disorders may affect persons of all ages, and may involve either intellectual or emotional processes, verbal or non-verbal behaviour. They may result from disturbances in biological function, or from the adverse influence of psychological or socio-cultural factors.

Psychiatry is the branch of medicine which deals with the recognition, treatment and prevention of mental abnormalities and disorders. It deals with illnesses which predominantly affect a person’s mental life and behaviour, i.e., his feelings, his thinking, his behaviour and social relationships¹.

Physician specialising in the diagnosis and treatment of mental disorders, the properly trained psychiatrist can provide a comprehensive evaluation from a psychiatric point of view, a medical differential diagnosis, treatment planning, and multiple therapeutic and health-enhancing interventions².
User Study:

Library & Information services starts and ends with the Users. Users are the focal point of all of their services (see the diagram below):

Diagram: **User**- the center of our universe

**Objectives of the Study:**

The objective was to study the Information Flow between Psychiatric Peers: how it flows, the mode of communication, the frequency of communication and the important areas on which they communicate.

**Methodology Adopted:**

Descriptive study has been taken following a case study method using questionnaires supported by interviews. Total study population was hundred psychiatrists.

**Findings:**

Information Flow between Psychiatric Peers:

Since the earliest days of Library & Information Science, our professionals were interested to research the significant communication routes between prominent peers in any particular community. Study of Invisible Colleges in different spheres was a salient feature within this type of study. One indirect effect of this informal communication channel is the inclusions sometimes made of scholarly peers' published or unpublished communication within their citation list.

This communication carries a special significance as because being busy professionals, it often is a very viable mode of information/experience/knowledge sharing between psychiatric community crossing the barrier of age groups which is evident from the
numerical results that follow which shows there is very high frequencies of scholarly communication among peers and which is not at all connected with age consideration-young, middle-aged or old- almost all psychiatrists acknowledge the importance of this in their information sphere. One reason may be that scholarly communication goes on strongly between peers is the rising popularity of group practice where psychiatric professionals with same Alma Mater or sharing some other same background flocks together to form Institutes to have the advantages of the both world: practicing alone and side by side having the opportunity of handy peer-communication whenever needed. One salient example in this case is ‘Mon’: an indoor and outdoor facility for the mentally disturbed at Kolkata 700032 which hosts 9 or more consultant psychiatrists with Masters Degrees in Psychiatric Medicine.

Mode of communication:

Psychiatrists communicate with their professional colleagues by different modes: through face-to-face conversation, over telephone, by email, by chat groups, by discussion forums. Age seems to be a relevant factor to choose this mode of communication: while the advanced age people still seems to prefer telephone, the middle aged uses lots of mobile messages to reach their colleagues and their still younger counterparts bask in the intricacies of email and Internet discussion forums. Some post graduate trainees and recently passed out share their professional thoughts over free Internet telephony (like Google Talk) or participate in the Psychiatric Community in Orkut.com.

Table: Information Flow between Psychiatric Peers (relationship of the terms in the table being top-to-bottom, not side-by-side)

<table>
<thead>
<tr>
<th>Communication</th>
<th>Frequency</th>
<th>Modes</th>
<th>Sought from</th>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Occasionally</td>
<td></td>
<td>Face-to-face conversation</td>
<td>Colleagues</td>
<td>New medicine</td>
</tr>
<tr>
<td>Daily</td>
<td></td>
<td>Telephone</td>
<td>Seniors</td>
<td>Side-effect of a drug</td>
</tr>
<tr>
<td>Weekly</td>
<td></td>
<td>Mobile messages</td>
<td>Teachers</td>
<td>New methods of treatment introduced recently in India</td>
</tr>
<tr>
<td>Monthly</td>
<td></td>
<td>Email</td>

</tr>
</tbody>
</table>

Topics of Communication:

From colleagues, they seek information on:

- Efficacy of medications
- Diagnostic clarifications
- Analysis of difficult cases
- Insight or hindsight into routine practice
- New concepts in aetio-pathogenesis
- Population trends
Clinical experiences
Their individual experiences regarding a particular treatment
Medico-legal problems in practice
Allied approaches like non-drug therapies, counselling
Indian trade names of compounds (for the people who have the British Medical Education)

Numerical Result 4:
How frequently the doctors make scholarly communication with peers

\[ X = \text{Age} \]
\[ Z = \text{(How frequently the doctors make scholarly communication with peers)} \]

<table>
<thead>
<tr>
<th>Not at all</th>
<th>Daily</th>
<th>Weekly</th>
<th>Monthly</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Data is known for 78 doctors.

Conditional Average \( E(X/Z=z) \)

<table>
<thead>
<tr>
<th>( Z )</th>
<th>Frequency ( f_z )</th>
<th>Conditional Average ( E(X/Z=z) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>43.5</td>
</tr>
<tr>
<td>2</td>
<td>40</td>
<td>38.61</td>
</tr>
<tr>
<td>3</td>
<td>24</td>
<td>39.37</td>
</tr>
<tr>
<td>4</td>
<td>12</td>
<td>46.41</td>
</tr>
</tbody>
</table>

Total 78 Grand Average = \( X = 40.19 \)

Comments: It is found that 78 doctors have answered the respective question. The others might have thought it not important enough to answer and hence ignored the question. The values of (conditional) expectations with moderately high frequencies of each group shows there is not significant difference between the respective ages of each group (the standard deviation of each group is high which makes the t-Statistics not significant).

Conclusion:

It is seen that the psychiatrists depend heavily on their peers for getting professional information. This is the result of several reasons including busy schedule, lack of proper libraries and/or resources, etc. In this context, we might try to be concerned of tendering a pinpointed, expeditious and judicious service in the field of psychiatry. Some points to consider here are:

- Creating a quality specialized library in Kolkata in the mental health sector
- Using special classification schemes for psychiatry books
- Using proper subject indexing done in this field
- Having adequate collection in government medical college & hospitals
- Setting up (or upgrading) libraries in the private hospitals & nursing homes
• Establishing Information Resource Centre in the field
• Creating Mental Health Information Portals
• Raising awareness about already existing Portals
• Popularising Open Access Resources in the field.

Different aspects of user needs in the domain of the psychiatry came under the microscope in this study. Our goal and mission is to enter into the ultimate user-centred LIS universe under the dynamic leadership of the digital librarian.

References:
1. Introduction

The 21st century library is mainly governed by the users' demand. User's opinion, content creation and sharing of information among their community, etc. are considered very important and thus the nature and services of the institutional libraries are changing very fast. Surviving and prospering of the library in this century requires a total rethinking of the nature of the present library condition, formulation of new ways of service oriented and user centric environment.

2. Demands and possibilities

Now-a-days, 24x7 multiuser access is a must along with virtual presence of the library. Users are to be served with actual document in the electronic format. Recent advancements in microcomputer technology and available software programme have opened up various new possibilities in the field of Library and Information Science (LIS). Library Management Software (LMS), Digital Library Software (DLS), Content Management Software (CMS) along with different technologies like RFID, Cloud Computing, etc. are now available for serving digital native patrons within the library or virtually, according to their needs. It is very vital that selection of software must be perfect and according to the need of the particular library. It requires a lot of decision making before actual implementation, otherwise there would the possibility of failure and wastage of time and money.

Selection of software is a very tricky job as it always depends on Operating System. So, implementations of LMS, DLS, CMS, etc. in combination, are to be considered keeping in mind mainly the Operating System and complexities during its installation and maintenance.

3. Operating System

"An operating system is the software that runs the computer, handling all interactions between the user and the hardware. An operating system isn't just one program; it consists of...
hundreds of smaller programs and utilities that allow us humans to use a computer to do something useful. A computer user then runs other programs (such as word processor) on top of the operating system to get everything done.

### 3.1 Microsoft Windows

Microsoft Windows is a series of operating system produced by Microsoft. Microsoft introduced an operating environment named Windows on November 20, 1985 as an add-on to MS-DOS in response to the growing interest in graphical user interfaces (GUIs). Microsoft Windows came to dominate the world's personal computer market, overtaking Mac OS, which had been introduced in 1984. As of August 2011, Windows has approximately 82% of the market share of the client operating systems according to Usage share of operating systems.

#### 3.2 Linux

Linux is a Unix-like computer operating system assembled under the model of free and open source software development and distribution. The defining component of any Linux system is the Linux kernel, an operating system kernel first released October 5, 1991 by Linus Torvalds. Linux system distributions may vary in many details of system operation, configuration, and software package selections.

Linux runs on a wide variety of computer hardware, including mobile phones, tablet computers, network routers, televisions video game consoles, desktop computers, mainframes and supercomputers. Linux is a leading server operating system, and runs the 10 fastest supercomputers in the world. In addition, more than 90% of today's supercomputers run some variant of Linux.
4 Selection of Operating System:

“You got to be careful if you don’t know where you are going, because you might not get there.” –  Yogi Berra

Windows and Linux are the most common OS used by the Indian users. Mac OS is very costly and less used OS in Indian market. Below is a chart to help illustrate the major advantages and disadvantages of Windows and Linux operating systems.

<table>
<thead>
<tr>
<th>Topic</th>
<th>Linux</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td>Price</td>
<td>Linux variants are generally available for free or at a much lower price than Microsoft Windows.</td>
<td>Single PC license costs around Rs.2500 to Rs.10000 (Except server) per copy.</td>
</tr>
<tr>
<td>Ease</td>
<td>Although the majority Linux variants have improved dramatically in ease of use, Windows is still much easier to use for new computer users.</td>
<td>Arguably it may not be the easiest operating system, it is still Easier than Linux.</td>
</tr>
<tr>
<td>Reliability</td>
<td>Very reliable and can often run for months and years without needing to be rebooted.</td>
<td>Microsoft Windows has made great improvements in reliability over the last few versions of Windows, it still cannot match the reliability of Linux.</td>
</tr>
<tr>
<td>Software</td>
<td>Linux has a large variety of available software programs, utilities, and games.</td>
<td>Because of the large amount of Microsoft Windows users, it has a much larger varieties of available software.</td>
</tr>
<tr>
<td>Software Cost</td>
<td>Most of the available software programs, utilities, and games available on Linux are freeware or open source. Even such complex programs such as Gimp, OpenOffice, StarOffice, and wine are available for free or at a low cost.</td>
<td>Limited number of free software available. Software are costly and available within the range of Rs.100 to Rs.500000.</td>
</tr>
<tr>
<td>Hardware</td>
<td>Linux developers and hardware manufacturers have made great advancements in hardware support for Linux and today Linux will support most hardware devices. However, many companies still do not offer drivers or support for their hardware in Linux.</td>
<td>Because of the amount of Microsoft Windows users and the broader driver support, Windows has a much larger support for hardware devices and a good majority of hardware manufacturers will support their products in Microsoft Windows.</td>
</tr>
<tr>
<td>Security</td>
<td>Very secure operating system. Although it still can be attacked when compared to Windows, it much more secure.</td>
<td>Despite continuous improvements over the years it is still most vulnerable to viruses and other attacks.</td>
</tr>
<tr>
<td>Open Source</td>
<td>Linux programs are open source and enable users to customize or modify the code however they wish to.</td>
<td>Microsoft Windows and most of the available software are not open source.</td>
</tr>
<tr>
<td>Support</td>
<td>Although it may be more difficult to find users familiar with all Linux variants, there are vast amounts of available online documentation and help, available books, and support for Linux.</td>
<td>Microsoft Windows includes its own help section, has vast amount of available online documentation and help, as well as books on each of the versions of Windows.</td>
</tr>
</tbody>
</table>

This comparison table clearly shows the advantages of Linux over Windows OS but majority of the market share goes in favour of Windows OS. We may assume that this situation is generally due to its user friendliness, ease of installation, available supporting companies for its maintenance or support and furthermore availability of useful software & marketing plans. Although Linux now supports GUI, still it needs extensive knowledge of its commands in non-GUI to execute software installation or maintenance. Moreover, most of
the hardware companies in India are not supplying Linux driver along with their products.

“Thus Windows desktop and its simple user interface has become synonymous with computing; while the various Linux operating systems offer a similar mouse driven interface and the Apple Mac continues to pioneer with its single button mouse, Windows remains the most popular and the most recognizable simply by virtue of its earlier successes and the work done by each release of the operating system to maintain this user familiarity”.

Thus we may find majority of Library Automation initiatives taken by the Govt. of India are in the Windows OS, either the SOUL or e-Granthalaya. Although in case of Digital Library Software (DLS) or Content Management Software (CMS), initiatives are lacking or not very suitable in terms of support or quality. Although there are some effective DLS or CMS available in the market and majority of these are open source and can be installed either in Linux or Windows OS.

In case of Library Management Software (LMS) there are various options available in the market. Some of these software are OS dependent and some may be implemented in all OS. Majority of the DLS and CMS can be installed in all available OS. But in terms of its implementation it requires a bunch of other accompanying software to execute the desired one. So, installation and implementation of these software requires some expertise. Following table shows some popular software, working environment and its software requirements.

<table>
<thead>
<tr>

</tbody>
</table>

This table clearly shows that majority of libraries those are trying to computerize their bibliographic data, all are using Windows OS based Library Management Software either free, local made or proprietary. Although some have purchased their LMS and still intended to migrate to other software clearly indicates that their software selection was faulty. Except some Universities most of the College libraries are still yet to implement OPAC beyond the library walls. They are far behind to serve their users beyond the library hours and not in a position to implement Digital Library services. Many libraries have invested a lot to procure the LMS, regardless its geographic location (rural or urban), but failed to achieve desired level of service.

6 Models

“There exist limitless opportunities in every industry. Where there is an open mind, there will always be a frontier.” ——— Charles F. Kettering

Today there are lots of software available in the market, either free or proprietary, still it is very hard to suggest a particular software for its implementation in the library environment. It depends on various other factors like users familiarity in terms of OS, technical knowledge, availability of funds, manpower, bandwidth, type of requirements, location of the library and user's socio-economic condition, and others.

Koha, an open source Integrated Library Management System, used world-wide by the libraries and India is not an exception. But it had withdrawn the support for Window version.
LibLime, a commercial entity providing implementation and development services of it in Linux. In November 2011, it was reported that LibLime had applied to New Zealand’s Ministry of Economic Development for a trademark of the name ‘Koha’. The Horowhenua Library Trust, who originally had developed Koha, has objected to LibLime’s proposal, saying that “the Trust had created something really good, and given it away to the world and that now LibLime wants to take it.” In the year 2010, LibLime was purchased by Progressive Technology Federal Systems, Inc. (PTFS). So, its fate is uncertain whether it would be free or proprietary in nature.

In case of LMS, as most of the libraries have initiated its automation in the Windows OS, we may assume that they are quite familiar with this OS and for this reason other software (DLS or CMS) are to be selected which are compatible in the same OS. In case of DLS, DSpace is very popular and can be used in Windows. It is true for the Greenstone also. But market share of DSpace is much higher and it supports collaborative environment. So, DSpace may be the best option.

There are some good options in case of CMS. Among these, Joomla is very popular. Drupal is a very competent software and often used commercially for developing websites of renowned houses like Discover Magazine, Lifetime, The Economist, and others. Both these are free and supported by huge community base. There is another name in the market and that is WordPress. It is also free and provides 3GB space for creating the webpage totally free of cost. It is popular among Bloggers, and thus considered as Blog making software. But it is very easy and supports customization to convert it as a static webpage or Web 2.0 compliant Blog. All CMS generally provide Web 2.0 features, option for RSS feeds and integration of Facebook, Twitter & others.

Based on all these discussions, we may conclude that for building the user centric library and providing support to the tech-savvy users in this 21st century, a library must have its virtual presence along with OPAC and digital contents. To ensure this system one must have to build its Web 2.0 compatible Library Portal and this is the foremost requirement. To fulfill this, libraries may seek technical assistance from within the institute or to the vendors. But updating the site is very important and thus librarian or library staff must be trained to be able to maintain their site of their own. OPAC and DLS may initially be implemented within the library itself for proper testing and experiment. When the library professionals feel comfortable with these, then only they may think of providing its online access. It requires some technical skills and lots of decision to be taken in terms of copyright issues, cost of the server, server maintenance, etc. Providing online access to OPAC and Digital Library are very simple. It can be achieved through the hyperlinks only but preparation of data and adopting proper implementation decisions requires lots of experience and time. These may be achieved through extensive trial and error method.

7. Concluding remark

So, everyone must come forward to test and share their experiences among their community. If a community is able to build an entire Operating System then sharing experiences before adopting anything for the library automation purpose, definitely ensures its right selection and ultimately users will be benefitted.

8. Bibliographies

Information Seeking Behaviour of Research Workers in Agricultural Field of West Bengal: A Case Study

Rina Naiya (Basak)\(^1\) and Amitabha Chatterjee\(^2\)

\(^1\)NIRJ AFT, Kolkata  
\(^2\)Department of Library & Information Science, Jadavpur University, Kolkata

Abstract: Research workers in different agricultural field remain busy in various Govt. organizations and universities to find out new technology and disseminate the same to the farmers at grass root level. In this regard they need information as and when required to fulfill their demand. They collect information from various sources and paths to cater their knowledge base. An effort has been made to find out information seeking behaviour and the hurdles they face during collection of required information of research workers in field of agriculture. A preliminary survey among randomly selected sample of 100 research workers of two districts viz., North 24 Parganas and South 24 Parganas of West Bengal of different Govt. organizations and universities were taken into this study. An attempt has been made to provide remedial measure for research workers to easy access to information. We have developed information dissemination model for easy access the information for Institute’s researchers.

Key words: Information; seeking behaviour; research worker; agriculture

Introduction

Research workers who have knowledge and expertise in advanced technology, usually seek exhaustive, expeditious and pinpointed nascent information from different sources at regular intervals to fulfill their need. They extend their knowledge, acquired through research, to the farmers. They used to collect required information from various sources and face different kinds of hurdles. An effort has been made to suggest remedial measure to overcome the hurdles.

Objective of the study

i) To determine information seeking behavior of research workers.

ii) To identify the problems in getting required information.

iii) To find out remedial measure to easy access to information.

Methodology

A couple of research workers were randomly selected and individually interviewed to ascertain their ‘Information seeking behavior’ and the barriers they encounter during collection of required information. The views obtained from them were utilized in preparing a questionnaire in English language for research workers.

150 questionnaires were distributed among research workers of different agricultural institutes, organizations, universities of North 24 Parganas and South 24 Parganas of West Bengal. Random sampling method was applied for selecting the research workers for this study. Data were collected through questionnaire method. 70% response were received from
both districts. A total of 101 complete filled-in questionnaires were received. Collected data received from research workers were analyzed and interpreted statistically and represent the same through statistical tables.

**Information Seeking Behaviour**

Research workers collect required information from various sources and different paths. Information seeking pattern might depend on the unique circumstances of the information seeking activities of the person concerned at the particular point in time. Different frequency of information search and their methods have been discussed below.

### Frequency of Information Search: Table- 1

Conference : conference; Meeting- meeting related to project programme
Not sought/not needed: The sources on which no response was received.

Table- 1 indicates that 77.2% of research workers attend seminars, conferences etc. at different intervals for obtaining required information, while the rest do not attend such event. The frequencies in which research workers attend seminars, conferences, etc, as observed from the table are:

a) Occasionally :- 62.40% of research workers attend conferences; 33.70% attend different meetings; 29.70% attend seminars and 23.80% attend various workshop.

b) Monthly :- 22.80% attend lectures; and 17.80% attend workshops.

c) By-monthly :- 13.90% attend workshops; 10.90% attend expert lectures; 8.90% attend meetings; and a negligible percentage attend conferences.

d) Quarterly :- 10.90% attend meetings; 5.90% attend workshops; and 4% listen to lectures.

e) Annually :- 27.90% attend seminars; 11.90% attend meetings; 7.90% attend workshops; and 5% to 6% attend conferences, lectures and other such events. The results reveal that quite a good percentage of research workers not interested to attend conferences, seminars, meetings, lectures, workshops etc to obtain the required information.

Research workers prefer different kinds of services for various reasons. **Table - 2** shows that among research workers 37.62% prefer current awareness service and 20.79% prefer selective dissemination of information due to their up-to-datedness. 39.60% use abstracting service due to its accessibility; 19.80% prefer abstracting services because of its up-to-dateness; 30.69% like to consult research-in- progress in their respective areas due to its accessibility and 25.74% prefer for then up-to-dateness; 20.79% prefer indexing service for its quality; 25.74% prefer translation service for its convenience to use; 18.81% use reprographic service due to its comprehensiveness; 39.60% prefer on-line service for easy accessibility and
30.69% prefer it due to its up-to-datedness; 23.76% prefer CD searching services due to convenience of use, 18.81% prefer it for its quality and another 17.82% prefer it due to its up-to-datedness.

Analysis of relevant data has shown that 74.3 % of research workers feel that Indian literature available on the Internet and on-line database are adequate while 25.7% of them feel that Indian literature are available on Internet and on-line database are not adequate. Table - 3 shows that 27.70% of search workers who are not satisfied with the Indian materials available on-line give first preference to consult printed Indian journals; 11.90% to consult cited references, another 11.90% to contact authors directly and 5.90% to visit other institutions to meet their requirement for the Indian information sources. It is found from the table that quite a good percentage of research workers (40 to 45%) do not collect information from Indian journals, cited reference, from other authors and by visiting other institutes while Indian literatures are not available on online database and Internet.

### Suggested information dissemination system for research workers:

From the study it is revealed that research workers encounter various problems in acquiring information either from their departmental library or other libraries, institutes due to insufficient and unsatisfactory service rendered to them by different means. Hurdles in acquiring necessary information/ data not only affect the flow of research work for which

![Fig. 1. Proposed information dissemination system for research workers for their easy access](image-url)
valuable time and money have been spent, but also culminate huge national loss. To overcome hurdles, existing information system needs modification. In this context some suggested measures are suggested:

1. Library staff may be amicable to research workers.
2. Open access library system is helpful for research workers.
3. Indian as well as foreign journals should be sufficient in the library so that the research workers can enhance their knowledge base.
4. Library staff may provide current awareness and selective dissemination of information service to research workers.
5. Easy accessibility to other libraries require for research workers to fulfill their needs.
6. Individual internet facility is one of the important criteria to update their knowledge.
7. An effort should be made to include more Indian literature in Internet and CD-abstract so that research workers may aware of Indian research works.
8. Inter-library loan facility may available to research workers for getting required information.
9. Service provided to research workers should be reasonably priced so that they can avail the facility.
10. Resource sharing facility of e-book and e-journal may be available so that research workers can get the benefit of such information source.
11. Consortium of journals that currently available should include more journals to facilitate research workers in their need.
12. Area of reading environment of research worker should be healthy.
13. Scanning and photocopy facility should be provided for research workers.
14. Before searching through the literature research workers should be well versed with the existing facilities available in the library (digitized documents, e-journals, hard copy volumes etc.) that will be expedite his/her search and simultaneously save precious time, the same may be provided by a CD/documentary made by the library staff and loaded to all computers/PC.
15. It is observed that research workers some time face problem in getting the real meaning of searched words/phrase. Hence well versed/advanced dictionary (subjective) should be kept in the library.
16. It is better to arrange seminar/lecture by the librarian to facilitate the research workers about the technical knowledge of the searching tools.
17. Library should develop own portal with the inclusion of latest social network tools so that research workers can interact of other organization through it or collection of their views,discussion etc.
18. Creation of Institutional Repository (IR) through digitized grey literature viz.seminar, conference proceedings, annual reports, bulletin etc. so that research workers can easily facilitate through it.
19. The Union Govt. with active participation and coordination of all State Govt, State sponsored research Institute's library should set up a fully computerized and dedicated “National Information Bank” to cater the information requirement of research workers/ information seekers.

Conclusion

It is observed from analysis that departmental libraries as well as other libraries are not sufficient to cater the information requirement of the research workers. Hence they search other sources to fulfill their need. In some cases research workers face problems in collecting required information resulting in their failure to achieve target in their respective field of study. It is difficult to overcome all sorts of barrier faced by the research workers due to some limitation of scope. Although a suggested remedial measure has been discussed yet it is no magic that can rectify all faulty systems within night's time still our dedicated effort should be there so that the research workers may success to fulfill their targets i. e. easy access to all sorts of information.

Innovative Teaching Strategies Used for User Education in College Libraries of West Bengal for the Maximum Use of College Library Resources

Dilip Kumar Mondal
Ramakrishna Mission Vidyamandira, Belur Math, Howrah-711202
e-mail: mondaldilipkumar@gmail.com

Abstract: The College Libraries are considered as the academic hubs of the teaching-learning process. Presently, the concept of college libraries in West Bengal is changing rapidly. The widespread of electronic technologies has had a tremendous impact upon information retrieval within the library. As well, there is increasing awareness of the need to develop information literacy skills among the students, teaching and non-teaching staff. The Library professional is to improve their skills and provide effective services to the users, so that all the resources in the library are extensively used. New services in the era of information Technology are discussed and the ways and means to orient the users to bring awareness about the CD/DVD and e-resources so that whatever amount is spent on them is used to the maximum extent by the users. Due to rapid change of technology, user education is reportedly changing in positive ways and incorporating more hands-on user training. The intention of this paper is to maximize the use of library resources with the help of user education through innovative teaching strategies in College Libraries of West Bengal.

Keywords: User education; Innovative teaching strategies; College libraries; West Bengal.

1. Introduction

Due to changes in technology, society and educational systems are having a considerable impact on libraries and their instruction programmes. These changes require information literacy programmes for users to become more effective, efficient and independent in their information searching. The goals of college library user education have expanded from teaching tools to teaching concepts and from college library instruction to information literacy and life-long learning.

According to Dr. S.R. Ranganathan, “the kind of education given to the library profession is normally reflected in the service given by the profession”. Though college libraries are service oriented, the tremendous changes brought about by technological advances in the present information society, have had an impact on their functioning. The recent developments in the field of information, communication and technology have also changed the expectations of the users in many ways.

The aim of this paper is to put college library user education in perspective and to explore issues relating to the importance of college library user education as an essential activity, such as the content, innovative teaching methods and how libraries and librarians can respond to the ever-increasing need for developing innovative strategies that would prove their value to users with emphasis on delivery of information rather than in warehousing them. Our focus will be placed on information dissemination and not in assets realization in the college libraries in West Bengal.
2. Concept and Meaning of User Education

User education simply means educating the college library patron, whether student, staff, or member of the public, on how to use the college library and its services. It should include any effort or program, which will guide and instruct existing and potential users in the recognition and formulation of their information needs, in the effective and efficient use of information services and their assessment.

User education, bibliographic instruction, college library instruction, college library orientation, reader instruction, information literacy are all terms which are used in the field of librarianship to describe educating college library users in the independent use of college library resources effectively and efficiently. Several experts, authors and college library professionals have created different definitional structures for the concept of user education or bibliographic instruction.

According to Salony (1995), “The systematic nature of the efforts to teach something a set of principles or search strategies relating to the college library, its collections or services - using pre-determined methods in order to accomplish a pre-defined set of objectives (p.32).”

Ideally User Education is a continuous process with the two components: Orientation and Instruction combined as necessary to the needs of the user.

Orientation means familiarization or adjustment to with particular situation. Orientation is concerned with enabling the user to become aware of the existence of the College library and the services available there, aiding the user to learn about the general use of College library.

Instruction is concerned with enabling the user to obtain information required for specific purpose by making full use of the resources and material available in the College library and is concerned with problems of Information retrieval.

3. Need and Objectives of User Education

According to (Koenig, 2003; Nicholas, 2003)," many students in higher educational institutions need this help because the courses are becoming interdisciplinary and their pattern is changing. It makes imperative for students to become better college library literate so that they can make the optimum use of the available sources of information." In the words of Fleming (1990), “various programmes of instruction, education and exploration provided by libraries to users to enable them to make more effective, efficient and independent use of information sources, resources and services to which these libraries provide access.” He emphasized the need for comprehensive programmes that aim to teach the concepts, skills and techniques of searching.

Orientation sessions, handouts, workshops, and course related and course integrated instruction are the activities aimed to achieve the goals of user education. The term ‘bibliographic instruction’ has more recently broadened to include the concept of information literacy. College library user education supports the concept of educating for a lifetime (life-long learning). The Think Tank II report on bibliographic instruction (Tiefel, 1995, p. 326) defined ‘information literacy’ as encompassing the entire world of information and seeking to prepare people to pursue the concept of lifelong learning. Information literacy extends its objectives to teaching information-seeking skills to all ages and at all times.

Fidzani (1995) demonstrates the following objectives of user education:

(i) to introduce students to facilities and resources in the college library;

(ii) to develop college library skills;
(iii) to make students independent users and learners in the college library;
(iv) to develop capabilities as self-sufficient users;
(v) to establish the college library as the centre of academic activity;
(vi) to provide basic understanding of the college library so that users can make efficient use of college library material and services;
(vii) to educate users about information sources and resources and how to exploit such resources effectively and efficiently.

In the colleges of West Bengal the need and objectives of user education has to be set the following perspectives:

(i) Introduce college library to first year students.
(ii) To introduce students to facilities and sources in the college library to meet their needs and make students independent users and learners in the college library.
(iii) To develop college library skills of users.
(iv) To develop self-sufficient users.
(v) To establish the college library as the centre of academic activity.
(vi) To provide basic understanding of the college library so that users can make efficient use of college library material and services.
(vii) To educate users about information sources and resources and how to exploit such resources effectively and efficiently.
(viii) To educate users about the information technology which is directly and indirectly related to information literacy programme.

4. Reasons for User Education

The reasons for educating user of information have been discussed many angel's. T.H. Cannon summarises the following reasons for user education:

(i) Change in the system of college examination from annual to semester, with emphasis on assignments, self study, etc.
(ii) Increases in the amount of available literature
(iii) The absence of good libraries at the elementary and secondary school levels in the West Bengal's educational system
(iv) Gradual introduction of computers in college library processes
(v) Librarians familiarizing users, who have little or no information seeking skills at all with a broad range of college library resources in order to develop college library skills.
(vi) Librarians educating users on how to find materials manually or electronically using on-line public access catalogues and CD-ROMs.

5. Levels of User Education

5.1 College library orientations: It is an introduction to college library building, card catalogue and some basic reference materials. The orientation aimed to the follows:

(i) Motivation for searching and using the information
(ii) Creating awareness about available information resources
(iii) Exposing them to various organizational tools of the college library

5.2 College library instruction: It teaches the users, how to use the indexes bibliographic tools, abstracts and other reference materials. This method often gives instructions to the researchers in their field to get specific information resources.

The aims are as follows:

Provide specific instructions to how to use and understand specific information system, information sources and tools.

5.3 Bibliographic instruction: Normally, it is difficult to use the bibliographic tools because of their organizational pattern. Thus, these instructions aim at:

(i) Exposing to the users to bibliographical tools.
(ii) Providing guidance's to understand the features of these tools and their nature of subject coverage. (Pandy, 1992).

It is generally agreed that there are three levels of user education which have been summarized by Rathore (1992):

(i) at the beginning of every academic year or semester ... applicable to all those who are using the college library for the first time, e.g. College library orientation and college library tour
(ii) subject oriented instruction for undergraduates at a stage when they are admitted to a special branch or subject of their choice or at the time of project work
(iii) Literature search training ... provided at the beginning of their research work

6. Concept of Maximum Use of Library Resources

A use qualifies to a maximum use status if it resulted in high value impact on any aspect of educational activity in an educational institution. A maximum use is a value added standard use. However, a maximum use may depend on viewer's perspective, time and context.

A maximum use of library resources may be innovative and be a philosophy, policy, strategy, program, process or practice that solves a problem or create new opportunities and positively impacts on institution.

7. Methods of Teaching for User Education

The effectiveness of user education programme depends primarily on teaching methods and media used for instruction. User education may be conducted in the following methods of teaching:

(i) Lecture method
(ii) Seminar, workshop, tutorials, and demonstration
(iii) Guided tour
(iv) Book exhibition.
(v) Display of new arrivals.
(vi) Mass media.
(vii) Advertising: (Paper, Journal, Posters, Pamphlets)
8. Innovative Teaching Strategies Used for the Maximization of use of College Library Services in West Bengal

The word ‘innovation’ is derived from Latin word ‘innovare’, which means to change something new. In other words it can be said that ‘innovation’ involves the practical implementation of new ideas.

Due to tremendous progress in information and communication technology, the scenario of contemporary teaching techniques is entirely changed. And the teacher of 21st should shed traditional concepts and techniques of classroom teaching and should adopt the recent and innovative teaching techniques.

Teaching User education depends on the potential excellence, skills and update knowledge of library professionals. The role of library professionals in present context has remarkably changed because of various factors such as social, cultural, economic and technology developments across the globe.

The subject of teaching User education at different levels in the West Bengal college education is very wide and the difficulties the librarian and the teacher faces are at large. Due to globalisation the world is changing rapidly, hence a library professional has to improve and update knowledge of innovative techniques to meet the demand of changing era.

Library professionals must be innovative, imaginative, and resourceful and have thorough knowledge of the subject and adopt new techniques to change socio-economic statues of West Bengal as well as the country.

8.1 Use of Information Technology (IT) in the College Library Services of West Bengal

The modern college libraries are at the behest of IT. The IT slowly and steadily transferring the libraries from traditional to modern. This results in the development of OPAC system, electronic document delivery system, multimedia applications, internet and so on. As the user of the college library bewildering fractional arrangements of classification and cataloguing, their implicational of IT complicated or aggravated this further. This results in preventing and minimizing the use of college library resources as well as services of the college library. To avoid these phenomena, it is necessary for libraries to redesign the user education programs, and in the changing environment user needs a specific training in the use of college library services (Devarajan, 1995).

According to Bauwens (1993), “knowledge of how to navigate the Internet is now becoming a basic requirement for information professionals. This would enable librarians to carry out instruction on the use of the Internet.”

From the above introductory discussion, the following areas may highlight where IT has worked as an innovative methods of teaching for user education:

8.1.1 Automation of College Library Services: The goal of this service is to automate all the house keeping operations viz. acquisition of books and other material, creating
maintenance of its catalogued database, circulation of its holdings etc, to give service more quickly, efficiently and effectively and thereby meet the fourth law of library science i.e save the time of the user. Online Public Access Catalogue (OPAC) facilitates the users to search for information by author, subject, title, ISBN, keywords etc and helps to reserve item on loan, view special collections, cancel reservations, request renewal of loan, to see list of new arrivals, request addition of new publication, define SDI profile.

8.1.2 Internet Facility in College Library Services: The goal of this service is to provide online access to information generated globally, web resources, open access resources, e-resources, institutional repositories etc. the users should be educated in the systematic approach to collecting the current information to support their projects, assignments, research work and other academic pursuits.

8.1.3 College Library Homepage: The goal of this service is to disseminate current information on various subjects to the users. The process involves regular display of information about the latest additions and other current information like job opportunities, fellowships, training, workshops, seminars, conferences, placements on the library website. This practice will facilitate the users to have access to timely and latest information pertaining to their academic and research interests.

8.1.4 Access to Digital Repositories in the College Library: The goal of this service is to create the digital centre of the faculty publications, research outputs, project reports, thesis and dissertations and college publications and locate the same on the website of the college library. This will facilitate the users to have timely access to the information on institutional developments, create an awareness of the institutional needs, individuals responsibilities and privileges. The process involves installation of digital repository software, internet and intranet connectivity.

8.1.5 CDNET Server Facility in the College Library: The goal of this service is to provide network access (Intranet) to the CD resources received regularly in the library to enable the users to access them at their desktops. The users need not deal with the individual CDs and DVDs. The information will be made available for access with remote access on the intranet. This involves installing a CDNET server like TULSINET where all the CD's can be dumped and users can access with various options, download and save the files.

8.1.6 Digitization of Manuscripts in the College Library: The goal of this service is to preserve and conserve rare documents and archaic material for progeny. All the old and rare documents are digitized and stored for future access by the potential users.

8.1.7 Local Area Network Facility in the College Campus: The goal of this service is to network the information resources of the library with the entire academic and research activities on the college campus and to evolve a user friendly environment by using the information and communication technology tools to provide quality and quick retrieval of the information sources along with resources available in other libraries at their desktops.

8.1.8 International Standard Formats for College Library Catalogue: The goal of this service is to record the bibliographic description of the document on an international standard format to globally enable the user to retrieve information easily and accurately. This involves entering bibliographic records using software which supports MARC 21 format to enter bibliographic records thereby facilitating downloading of records from Library of Congress or British Library Catalogue or OCLC to avoid duplication of entries. This helps to achieve, uniformity, accuracy and standardization.

8.1.9 Web-based User Education: The goal of this service is to web guides and teaching tools are found everywhere on the Web because they are easily updated, accessed, and
printed on demand. They may include color graphics, and screenshots. The best ones gather librarian-selected Web links, subscription resources and college library materials in well-organized pages.

It is too much to expect that one college library or person can produce the best guides to every resource. Web links to the best work of others are an enduring trend.

A few libraries have developed web tutorials and training modules. If well done, they can approach the quality of multimedia authoring software.

8.2 Some Other Innovative Techniques that Maximize the Effective Use of College Library Services:

8.2.1 In Service Training: The goal of this programme would be to motivate professional staff to enhance their skill and expertise in conventional and e-library associated services and operations by arranging in house and external training programmes.

8.2.2 Staff Promotional Policy: The policy involves designing and implementing a transparent promotion policy with requirements in terms of qualifications, length of service, expertise, regularity etc. with a time frame for promotion. This service will motivate the library staff to acquire higher qualifications and experience required to get a promotion to the next higher grade.

8.2.3 Student Internship Programme: The programme involves practical training in the different sections of the library to the students of library and information science to enable them to get a clear understanding of library organization, management and library functioning.

8.2.4 Student Participation Programme: This programme helps students to involve themselves in the maintenance of the Library. This practice will not only inculcate a sense of responsibility and accountability but also develops a service mind.

8.2.5 Extended Hours of Service: Extended hours of library opening helps the users, especially students during examination time to utilize the services optimally and thereby fulfill the first law of library science i.e. documents are for use.

8.2.6 E-Training Programme: Publishers demonstrate and organize training sessions to launch the new databases which are to be attended by the library personnel to orient themselves about their usage and to instruct the users on how to navigate and locate journal articles efficiently and effectively. They are also taught on how to write and publish their research articles in journals.

9. Conclusion

The college libraries in West Bengal faced enormous challenges and opportunities at the end of 20th century. As campuses move into the information age, the mission and role of the college library is being redefined. While the amount of information libraries need to acquire continues to increase, the resources available to do so are insufficient. Use of technology in designing and delivering the information products and services in a library has always yielded good results. Automation of all in-house operations in college libraries with bar-coding, user identity and web OPAC facilities is a maximum use in totality of library services. Effective implementation of user education/awareness programs with the innovative techniques and tools will also be a maximum use in extent of library services. Developing digital repositories with subject content, open sources and institutional information and customizing it to internal requirements with remote access is one of the globally adopted
best uses in the college libraries. In the present era of IT, the college libraries need to re-orient to the highly qualitative information collection and services.

The growing universe of print-based publications and digital documents on the one hand, and the declining universe of college library budgets on the other, can be handled confidently by adopting certain strategies, such as by developing critical thinking skills, as well as promoting information literacy at large. In the near future, users should expect timely access to quality information. Incorporating end-user education in college libraries by developing training programs for the library and information professionals, as well as the end-users, will hopefully improve learning attitudes and network-related competence to use with information and communication technologies.

Users' Confidentiality and Privacy: A Growing Concern for the Libraries/Information Centres

Abhijit Chatterjee and Arabinda Maity

1Department of Library and Information Science, University of Calcutta
email: abhijitchat977@gmail.com
2Department of Library and Information Science, University of Calcutta
email: amaity@caluniv.ac.in

Abstract: Librarians now use many technological tools to provide better services to the users. Sometimes these tools create problems regarding privacy and confidentiality of users. Various kinds of users' records are kept in the library to keep the information about the users. Maintaining confidentiality and privacy in the library/information centre is very important. Privacy in digital era is of more concern to the user as it is very easy to access the users' records. The paper discusses the role of the librarian in this regard and also puts a few suggestions to maintain privacy in libraries and information centres.

Keywords: Users' Security, Confidentiality, Privacy

1 Introduction

The library is always considered as a safe place for study and research. But the library surroundings are not always safe and secure from outside threats. As a storehouse of knowledge it is not free from dangers of different types. With the increasing use of technological tools such dangers have increased manifold. The different kinds of security problems that may occur in modern libraries and information centres may relate to:

- Theft or vandalism of library materials
- Collection safety
- Fire security
- Network and computer security
- Privacy

The growing rate of document loss or vandalism has surely become a cause of concern for the service professionals. Apart from this, some new hazards relating to library security have since cropped up with increasing application of information technology and massive use of digital and online resources. These developments demand more preventive measures in libraries and information centres.

2 Privacy and Confidentiality

Privacy has different meaning in different perspective. In general A.S. Sodiya, H.O.D. Longe, A.T. Akinwale (2007) defined privacy as the “state of not making activities of someone..."
available to others; while according to Alan Westin (1967) “Privacy is the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.” So, the privacy is duty of the concerned authority about not to inform the user information to the third party. But in terms of library the meaning is different altogether. According to ALA (2005), “in a library (physical or virtual), the right to privacy is the right to open inquiry without having the subject of one’s interest examined or scrutinized by others. Confidentiality exists when a library is in possession of personally identifiable information about users and keeps that information private on their behalf.”

3 Importance of Privacy and Confidentiality in LIC

Privacy and confidentiality is the neglected area in libraries for several years. Privacy appeared as a new concern for the library in the late 1960s. The series of conflicts between law enforcement agencies and librarians forced the authorities to formulate the policies regarding privacy policy. Later American Library Association’s (ALA) formulated separate library privacy policy. The major movement towards library privacy took place in the aftermath of the Democratic National Convention in Chicago in 1968. The issue got much importance with the rapid application of technological equipment in libraries and information centres. Privacy is the common and minimum demand for the users to the library staff. The following can be considered basic importance of privacy in library and information centre:

- Library can provide mental peace to the users.
- Users need privacy to pursue difficult thought process without interference.
- Users carrying research work always try to ensure privacy in libraries to avoid others knowledge about the study he was following.
- Users can feel safe in the library surroundings.
- The users do not want to expose his reading habit or document usage history records to others.
- Users' personal information is very much important for the users.
- Users can enjoy barrier free service in the library.
- To maintain individuality.

4 Privacy of Library Records

A library possesses different kinds of records for providing service to the users. These records are very much important to the library for preparing various annual reports and statistics for the authority. Besides these records are very confidential as these consist of the record of several individuals. A library record is the information which contain the names or other personal identifying information regarding the users. The library records should not be exposed to any person except certain cases and shall be kept confidential and shall not be disclosed. The users' records that may be maintained in a library/information centre are of two kinds as shown below:
Kinds of Users' Records Maintained in Library/Information Centre

<table>
<thead>
<tr>
<th>Personal Information</th>
<th>Personal Library Records</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Circulation Records</td>
</tr>
<tr>
<td>Gender</td>
<td>Overdue Materials Records</td>
</tr>
<tr>
<td>Date of birth</td>
<td>Inter-library Loan Requests</td>
</tr>
<tr>
<td>Card numbers</td>
<td>Database Search Requests</td>
</tr>
<tr>
<td>Telephone numbers</td>
<td>Requests for Photocopy</td>
</tr>
<tr>
<td>E-mail id</td>
<td>Request Slips for Materials in Closed Stack</td>
</tr>
<tr>
<td>Residential address</td>
<td>User Profiles for SDI Service</td>
</tr>
<tr>
<td>Designation</td>
<td>Records of webpage visited on terminal</td>
</tr>
<tr>
<td>Office address</td>
<td>E-mail messages sent and received</td>
</tr>
<tr>
<td>Employer's Name</td>
<td>Records of individual consultations with patrons</td>
</tr>
<tr>
<td>Annual Income</td>
<td>Copies of messages generated through e-mail or chat reference services</td>
</tr>
<tr>
<td>Area of interest</td>
<td>Sign-up sheets for use of computer terminals or other library resources</td>
</tr>
<tr>
<td>Driving license number</td>
<td></td>
</tr>
</tbody>
</table>

The above is an example of types of personal information required in the library for keeping track of the user and for providing better services. But the types of requirement of the user information may vary depending upon the library.

5 Privacy and Confidentiality in Digital Environment

Today the world of libraries has transformed from manual to semi-automated to digital. Application of information technology has virtually touched almost every aspect of the library and information centre. Internet and digital technology is used in most of the library/information centre. The proper privacy guidelines are not well established till now. But it is very clear that privacy of accessing library files is less possible in digital environment. Users' records are stored in computerised files and accessing these records has become easier to the other users. The libraries providing service in digital environment may hold many types of personal data. These may include:

- Electronic Membership files
- Electronic publication files consulted
- Electronic User profiles for dissemination services
- Records of online searches
- E-mail and Internet searches
- Web pages visited

The use of Internet in libraries and information centres has made the situation worse. UCLA Internet Report (2000) shows that 63.3% Internet users and 76.1% of non-users agreed with the statement that “people who go online put their privacy at risk.” The increasing
threats in digital environment have forced the service professionals to adopt the new methods to maintain user privacy.

6 Role of Librarian

In today’s world the role of the librarian is diverse in nature. He has to provide different new services through application of several new techniques and methods. The librarian is not only responsible for providing services to the users but also looking into the matter of user facilities. The role of the librarian is always critical and tough in the matter of maintaining privacy and confidentiality since the librarian, along with the other library staff, is solely responsible for preserving privacy in the library environment. Following are the basic responsibilities of the librarian regarding securing of library records:

- The librarian should formulate a clear privacy policy for the library/information centre.
- All library records and user related information should be stored under secure condition.
- There should be different levels of accessing user related information within the organisation.
- There should be password provision for accessing machine readable records.
- The library staff should not share any kinds of user related information with outsiders.
- The library staff should not share or disclose user IDs or computer security passwords or other security safeguards with other persons.
- The library records should not be altered without appropriate authorization.
- Restricted library records should not be accessible to general library staff.
- The librarian should not release suppressed, private, or confidential information without authorization.
- The librarian should not publicly discuss data records related to employees, students, or staff in such a way that an individual may be identified.
- The librarian should delete personal information like reading history regularly after a stipulated period.
- The librarian should not disclose any kinds of user information except those that may be needed in legal cases.
- The librarian should not to collect unnecessary information from the users.
- The librarian should be careful about possibility of sale of users' personal information by some insiders to any outside party.

The above are the basic ethical and moral responsibilities of the librarian. Doctors and lawyers are responsible for not disclosing information relating to their clients to others. Likewise, librarians are responsible for maintaining users' personal information which can only be used for the library services and user record keeping. There should be certain code of ethics for the library professionals. According to Irina Trushina (2004), there are 28 Codes of library ethics in different countries like USA, Canada, Japan, Australia etc. The code of ethics can provide a basic foundation for the direction of the library staff while dealing with privacy issues in the library/information centre. But in certain cases librarians are compelled to reveal
users' personal information, which is violation of the confidentiality or privacy of users and thus breaking of the code of ethics. According to Lisa Zhao, following are the exceptions in most of the US state laws:

- When there is a need to use patron records to examine the library operation, such as how many new people applied for a library card and used the library, and the flow of circulations, the personal identifiable information must be deleted first before using the data.
- To the extent that is necessary for tracking overdue or stolen materials and for collecting fines.
- If the library has the written permission from the patron.
- In response to an order issued by a court of competent jurisdiction upon a finding that the disclosure of such record is necessary to protect the public safety or to prosecute a crime. Under these circumstances, the following aspects should be considered:
  - If the order abides by the legal procedure for inspecting individual information.
  - If the required information is reasonably related to the case.
  - If not having such information will endanger some people or a witness's safety, disrupt official investigation, or lead to a suspect escaping from the investigation, or destroying evidence, etc.

7 Privacy and Confidentiality Policy in LIC

The privacy and confidentiality is a growing concern for the libraries and information centres. To protect user privacy the most important thing is to adopt proper and well defined policies in the library. The librarian as the in-charge of the organisation should take proper initiatives to formulate privacy policy for the library. Librarian may adopt some other library's privacy policy as their policy or formulate a new one. Formulation of new privacy policy needs in depth understanding of the issue and its various sub-areas. American Library Association (2005) proposes five "fair information practice principles" which would serve as a guideline to develop a library privacy policy. These are as follows:

- Notice and openness to the user about the library policies on privacy and confidentiality of their personally identifiable information.
- Choice and consent of the user on the usage of their personal information.
- Access by users to their personally identifiable information.
- Data integrity and security of personally identifiable information.
- Enforcement and redress the libraries should adopt steps to establish and maintain an effective mechanism to enforce their privacy policies. Redress to the users should be made available if the users feel that their right to privacy has been violated by the library.

7.1 Privacy Policy Abroad

In western countries, specially in USA privacy and confidentiality policy is widely practised in different types of libraries. The privacy policy framework is very strong in most of the libraries in USA. The privacy policy in different libraries is usually governed by the ALA Privacy Policy statement. The practices of a few libraries are given below as examples.
7.1.1 College Library
The Dartmouth College Library, Hanover, USA
- The college library has a clearly declared privacy policy.
- It protects the privacy of those who use the library.
- It uses personal information only for the circulation purposes.
- The USA Patriot Act overrides state library confidentiality laws protecting library records and the library will comply with it. The library's privacy and confidentiality policy has not changed as a result of the Act.

7.1.2 University Library
Harvard University Library, Cambridge, USA
- The university library has a clearly declared privacy policy.
- The library policies conform to the Code of Ethics of the American Library Association.
- The library stores personally identifiable information for normal loan operations, or for other services.
- The library gathers data about system and resource usage for administrative purposes; the use of that information conforms to the concept of confidentiality denoted by the Code of Ethics statement.

7.1.3 Public Library
New York Public Library, New York, USA
- The library has a clearly declared privacy policy.
- The confidentiality of library records is governed by New York CPLR 4509.
- The library has physical, electronic, and managerial measures in place to prevent unauthorized access to the collected information.
- Library records containing personal identifying details regarding the users are kept confidential and used for service purpose and are not disclosed to the extent necessary for the proper operation of the library and are disclosed only upon the request or consent of the user or pursuant to subpoena, court order or where otherwise required by statute.

7.1.4 Special Library
Carnegie Museum of Natural History, Pittsburgh, USA
- The library has a clearly declared privacy policy.
- There is special privacy provision for Digital Discovery Room of the library.
- CMNH collects information from the user solely for service purposes.
- Certain information cannot be deleted because of some legal obligations.
- The information collected from the users are not disclosed to any third party.

7.2 Indian Scenario
Our country is rapidly developing in respect to service provision and digitisation but the basic foundation of privacy policy framework is not yet done. There is no general privacy law
in India. But there is right of privacy guaranteed by Indian laws. Although the "National Policy on Information Security, Privacy and Data Protection Act for handling of computerized data." is in pipeline and expected to be enacted as a law within a few years. Information Technology (Reasonable security practices and procedures and sensitive personal data or information) Rules, 2011 have come into effect on April 4, 2011 which provides detailed rules regarding personal information and disclosure of information in certain cases. But no single library in our country has clearly laid down privacy and confidentiality policy. Only a few static rules is there which cannot help much in handling the difficult situation if privacy issue arises within the library premises.

8 Conclusion

With the advancement of technology, privacy and confidentiality are becoming a matter of more serious concern for libraries and information centres. Librarians around us are still not very much aware of the privacy issues. Librarians serving the user community are now in a dilemma to decide their preferences. The motto of the library professionals should be more focused to hazard free user services. The users' personal information should be disclosed only if the case is in legal jurisdiction. There is also need to develop awareness among the general people regarding their right to privacy and confidentiality. The tremendous social and technological changes in the country have brought some awareness regarding privacy in India. But the focus is more on technological area rather than libraries. It is the duty of the professional organisations to take the issue to the government and force them to formulate privacy policy for the libraries in India. Librarians on their part may also take some measures to improve the privacy situations in their concerned organizations. Some suggestions are given below which may be considered for improvement of privacy situation in libraries in the country:

- Every library/ information centre should formulate or adopt a users' privacy policy.
- The condition of the privacy in libraries and information centres should be assessed and loopholes in privacy protection should be plugged.
- Strict vigilance of the users' records held in the library should be maintained.
- User's information, which are important for providing library services, should only be collected.
- User records, which are not needed in future, should be deleted immediately after the purpose for which these have created are fulfilled.
- There should be necessary restriction of accessing users' personal information by the library staff.
- Awareness about privacy among library staff, administrators and users should be created.
- Password protection system should be introduced for accessing records in the computer system.
- Library consortia should be forced to respect privacy policies of individual libraries.
- Inter-library loan requests should not include names of patrons for whom the requests have been made.
- Web server log should be deleted regularly.
- Cookie files should be deleted or browser should be set to reject cookies.
- History of the users' web page visits should be deleted regularly.

3. Privacy: An Interpretation of the Library Bill of Rights, ALA
Assessment of Information Use Habit of Library and Information Science Students of Jadavpur University

Swaguna Datta
Central Library, Jadavpur University
E-Mail: swaguna_datta@yahoo.co.in

Abstract: The present day society is rapidly transforming into an information society. The pattern of information use by different components of the society needs to be assessed in order to cater the information needs and manage the same effectively. The effect of advancements and developments in various fields of information technology and science including information sources, mode of information transfer etc. gets most pronouncedly and quickly reflected in the information use pattern of students. In the present paper the information use pattern of the library and information science students of Jadavpur University has been assessed through a sample survey. The survey is divided into three distinct parts. In the first part the use preference of the students among nine different available library options has been assessed. Both BLIS and MLIS students seem to prefer the departmental library most for curricular study. In case of extracurricular studies both BLIS and MLIS students mostly preferred the central library-reference section and libraries other than the university libraries. In the second part the use preference and purpose of eight different available information sources are assessed. Among the given options study books, newspaper and telephone are used by a high percentage of students from both categories. The computer and internet use is higher among the MLIS students than the BLIS students. The third part briefly investigates about the use of internet. It is observed that most of students use the internet facility provided by the university. However, MLIS students use the university facility more effectively thereby lowering their average monthly expenditure for internet use.

Keywords: Library Use, Information Use, Library and Information Science Students

1. Introduction

The present day society is rapidly transforming into an information society. Beside the advanced and developed countries it is a reality for a fast growing economy like India as well. In fact the rapid advancement of India in information science and technology is one of the main driving forces behind the fast growth, the country is experiencing at present. The pattern of information use by different components of the society needs to be assessed in order to cater the information needs and manage the same effectively.

The effect of advancements and developments in various fields of information technology and science including information sources, mode of information transfer etc. gets most pronouncedly and quickly reflected in the information use pattern of students. In the present paper the information use pattern of the library and information science students of Jadavpur University has been assessed through a sample survey. Library and information science students are more likely to be aware of the different kind of information sources and the proper methodology to use them. For this very reason they are chosen as the subjects for the present study.

Several researchers have carried out studies regarding the reading habits and information use patterns of students and only a few are mentioned as follows. Tenopir (2003) made a
detailed review and analysis of research studies regarding the use and users of electronic library resources. George et al. (2006) studied the information seeking behavior of graduate students of Carnegie-Mellon University through semi-structured interviews. Tella et al. (2009) studied the library use of poly-technique students in Nigeria. The information use by the college students of United States was assessed through a survey among 8353 respondents of twenty five campuses all over the country by Head and Eisenberg (2010). Bratovic et al. (2010) analyzed the reading habits of library and information science students of Croatia, Slovenia and Austria. Nagata et al. (2006) studied the library use pattern of university students of Japan and Finland through surveys and interviews.

2. Methodology

In this study an attempt has been made to assess the information use habits of the library and information science students of Jadavpur University. A survey was conducted among the undergraduate and post-graduate students. A total of thirty-two students (eighteen undergraduate i.e. BLIS and fourteen post-graduate i.e. MLIS students) were provided with printed questionnaire. The collected data are further analyzed and represented in the form of tables and graphs subsequently.

3. Results and Discussion

The survey is divided into three distinct parts. In the first part the use preference of the students among different available library options has been assessed. In the second part the use preference and purpose of different available information sources are assessed. The third part briefly investigates about the use of internet. The results are presented and discussions are made as follows. The responses of the BLIS and MLIS students are compared in all the cases.

Assessment of Library Use Preference

At the beginning the students were provided with nine probable library options for curricular studies and studies for other purposes. The options include the departmental library, different sections of central library and the libraries other than the university library. Information was collected regarding their preference among the available options. The results are presented in Table-1 for curricular studies and Table-2 for extra curricular studies.

</tr>
</tbody>
</table>

The results show that the departmental library is used by all the students (both BLIS and MLIS students) for curricular studies and the thesis section is availed by none of them. Apart
from that, for BLIS students mostly availed library option is the central library-reference section followed by central library-reading room while the least preferred options are the central library-serial section and central library-digital library. However, for the MLIS students, the most preferred option is the central library circulation section followed by the central library-digital library and central library-reference section. Also, they do not seem to prefer libraries other than the university libraries for curricular studies. Figure-1(A) shows these preferences graphically.

</tr>
</tbody>
</table>

In case of extra-curricular studies the library use preference of the students is different in nature. Both BLIS and MLIS students mostly preferred the central library-reference section for the purpose. Unlike curricular studies, libraries other than the university libraries are highly preferred for extra-curricular studies. Some of the students are also found to not use any libraries for the purpose. Figure-1(B) shows these preferences graphically.

**Assessment of the Preference and Purpose of Use of Different Sources of Information**

After surveying the students about their library preferences, the use of different sources of information is assessed. The students were provided with eight most commonly used information source options such as newspaper, radio, television, computer, phone, internet, study books and class notes and other books. The study is divided into two parts. Firstly, they
were asked to state the average time for which they use the options per day. The results are shown in Table-3.

</table>

It can be seen that all the students use study books and class notes as expected. Apart from that, newspaper and telephone are used by a high percentage of students from both categories. The computer and internet use is higher among the MLIS students than the BLIS students. Radio is used by least percent of students from both categories.

From Table-3 it can also be observed that the average times spent by the BLIS and MLIS students in using these eight sources of information are 8.74 hour/day and 10.20 hour/day respectively. The relative proportion of the total time spent for using these options are calculated and presented in Figure-2.

![Figure 2: Use of Different Sources of Information by (A) BLIS Students (B) MLIS Students](image)

For both of the student categories, highest percentage of time is found to be spent for using study books and class notes followed by the same for using telephone. In both the
cases the least time is pent for using radio. Percent time spent for using digital sources such as computer and internet is found to be higher for MLIS students (28%) than the BLIS students (17%).

During the second part of the study the students were asked to choose among five stated purposes for using each of the eight sources of information already mentioned. The choices were sharing of general news, sharing of other informations, sharing of internet and sports related information, study and communication. The percent of the total student choosing a purpose for a particular source is calculated and presented in Table-4.

</tr>
</tbody>
</table>

Newspaper is found to be the mostly preferred option for sharing general news by both categories. For sharing other information internet was chosen by most number of students. Television served the purpose of sharing entertainment and sports related information for the majority. As expected, study books and class notes were used by most number of students for study purpose and for communication; telephone has been the chosen preference. Among all the eight options internet is found to be the only one used by both categories of students for all the stated five purposes. The computer, newspaper and other books took the next three places.

3.3 Use of Internet

In the final part of the survey, a couple of queries were made regarding the place of internet use and the average monthly expenditure for the same. The results are presented in Table-5.

Table 5: Place and Cost of Internet Use

<table>
<thead>
<tr>
<th>Category of Students</th>
<th>Place of Internet Use</th>
<th>Average Monthly Expenditure (Rs./Month)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>University</td>
<td>Home</td>

<tr>
<td>Percent of BLIS Students</td>
<td>38.89</td>
<td>16.67</td>
</tr>
<tr>
<td>Percent of MLIS Students</td>
<td>78.57</td>
<td>50.00</td>
</tr>
</tbody>
</table>
From the results, it can be seen that most of students use the internet facility provided by the university than the other two options. However, MLIS students use the university facility more effectively which also lowers their average monthly expenditure for internet use.

4. Conclusion

In this study an attempt has been made to assess the information use habits of thirty two library and information science students of Jadavpur University through a questionnaire survey. The survey is divided into three distinct parts. In the first part the use preference of the students among nine different available library options has been assessed. Both BLIS and MLIS students seem to prefer the departmental library most for curricular study. In case of extra-curricular studies Both BLIS and MLIS students mostly preferred the central library-reference section and libraries other than the university libraries.

In the second part the use preference and purpose of eight different available information sources are assessed. Among the given options study books, newspaper and telephone are used by a high percentage of students from both categories. The computer and internet use is higher among the MLIS students than the BLIS students. The average times spent by the BLIS and MLIS students in using these eight sources of information are 8.74 hour/day and 10.20 hour/day respectively. For both of the student categories, highest percentage of time is found to be spent for using study books and class notes followed by the same for using telephone. Percent time spent for using digital sources such as computer and internet is found to be higher for MLIS students (28%) than the BLIS students (17%).

The third part briefly investigates about the use of internet. It is observed that most of students use the internet facility provided by the university. However, MLIS students use the university facility more effectively thereby lowering their average monthly expenditure for internet use.

Present research reveals the detailed picture of the information use pattern of library and information science students of Jadavpur University. Similar kind of studies can be carried out for the students of other disciplines as well. This kind of information can also be collected for a longer duration of few consecutive years to get a clear temporal trend of information use pattern of university students. Based on the obtained trend the library service of the university can be designed more effectively to cater and manage the information needs of the students.

Virtual Reference Service in Academic and Research Libraries: An Overview

Lalit Mohan\textsuperscript{1} and B. S. Kademani\textsuperscript{2}

Scientific Information Resource Division
Bhabha Atomic Research Centre, Trombay, Mumbai
E-mail : lalitm@barc.gov.in; bsk@barc.gov.in

Abstract: The concept of reference services advocated by Dr. S. R. Ranganathan, the father of library science and now due to developments in web 3.0, reference services can be effectively rendered in the digital environment remotely at the desk top of users. In true sense, Virtual Reference Service can be established or rendered in two ways, leaving apart other modes like telephone, fax etc. The study emphasizes the significance of Virtual Reference Services in the Academic and research libraries providing conceptual overview of the concept and literature reviews. This study further attempts to explore the Virtual Reference Services carried out by libraries in India and also heralds the importance of QuestionPoint service of, OCLC in pursuance of reference services for the benefit of users in clarifying and seeking the information in a network environment. Concludes that this sort of e-reference services can be planned in setting up the same and administer to ensure innovation for better tomorrow.

Keywords: Reference Service; Academic Library; Research Library

1.0 Introduction

Libraries have been identified as one of the key elements for open access to information, which is crucial to democratic information society development and hence, the role of libraries is central focal point in catering to the timely needs of the users in the networked environment. But today, academic and research libraries are struggling to keep their place in the face of emerging digital technology that has revolutionized not only the way information is packaged, processed, stored, and disseminated, but also how users seek and access information.

According to Dr. S. R. Ranganathan (1961), 'Reference Service is the process of establishing contact between a reader and his documents in a personal way'. He further asserts that Reference service is personal service to each reader in helping him to find the documents answering his interest at the moment, pin-pointedly, exhaustively, and expeditiously. According to Ranganathan, there are two types of reference service: Ready reference service is reference service finished in a very short time-in a moment if possible and long range reference service is a reference service takes longer time i.e. more than half an hour to the required to complete the query.

Ranganathan believed that effective reference service is vital to the user community and should be one of the essential services in any type of library be it academic, research and public. According to fourth Law of library science "Save the time of the reader", the user should be in a position to get the information instantaneously wherever he is. The advent of Computers, computing technology or Information Communication Technology (ICT) which are the key determining technologies of the twenty-first century has enabled the librarians to take the reference service directly to the users. As all of us know science has advanced so
much and many noted discoveries made by the scientists have not made so much impact on
the society and the common man that the information and communication technology has
made. It has made tremendous impact on every sphere of human activity. In fact it helped in
fueling the accelerated growth be it a business, industry or a scientific research and libraries
are no exception.

Internet revolution provides access to a world of information to the countries and
individuals which was never witnessed before. The digital technology has created a
fundamental change in the efficiency of providing communication services. It has also made
available the new facilities in the customer equipments for simple, cheap, fast and instant
global document transmission. The internet has produced amazing opportunities that have
never been available before. These opportunities include:

- access to a wealth of information sources completely independent of geographical
  isolation
- participation in global markets
- easy access to wide range of cultural experiences that can foster individual
development and learning

Information sharing is the basic benefit in all these areas. Access to the world’s largest
libraries is available to anyone who has internet. Very powerful search engines available to
assist you in locating the information. Email discussion forums, social networking sites, blogs
etc., are available to keep you alert and informed in your field of interest.

In the light of the fourth law, it is important to consider the developments in Information
and Communication Technology (ICT), networked systems, and especially the advent of the
World Wide Web have driven rapid changes in academic and research libraries, in which
almost every aspect of library work has been dramatically influenced by the Web enabled
enhanced access to collections and services. The impact that the Internet has had on the
traditional reference desk is such that one finds oneself questioning the validity and
effectiveness of traditional reference services. Patrons’ ability to look up for information on
the Internet and the ability of paraprofessionals to answer directional questions puts into
doubt the value of the traditional reference model’s expensive and time-consuming (to staff)
desk. Hence re-examining the current iteration of this save the time of users to ensure that we
are addressing and facilitating change effectively leads to the concept of Virtual Reference
Services.

In this context, there is a serious challenge to the planners, policy makers, library
administrators and library and information science educators to critically think as to how
best the existing libraries could be converted as Learning Resource Centers to support
educational, social, cultural activities of the researchers, academicians and contribute to the
information needs to support learning, teaching and research activities by providing e-
resources, creating indigenous databases, research productivity and learning course
instructional materials.

2.0 Virtual Reference Services: Characteristics

Virtual reference has grown from a topic of largely theoretical conversation to a very real
and increasingly basic library service. At the time of the first Virtual Reference Desk
Conference in 1999, though excitement was high, there was no easy way for libraries to start a
new virtual reference program. Today, libraries have a growing number of virtual reference
options. Libraries can provide virtual reference by building a platform from scratch, using a
specialized software package, or adapting a general tool such as instant messaging (IM).
Librarians can take advantage of these real-time communications tools i.e. virtual reference systems with today's real-time communication tools.

According to Lankes (2003) “Virtual reference is reference service initiated electronically, often in real-time, where patrons employ computers or other Internet technology to communicate with reference staff, without being physically present. Communication channels used frequently in providing virtual reference service include chat, videoconferencing, and voice over IP, co-browsing, e-mail and instant messaging.”

Virtual reference can deliver a reference service by electronic means, from asynchronous via e-mail and web forms to real-time via chat, web push, etc. An ideal VRS should provide professional reference service to patrons anywhere, any time, but in most cases, no single library will have the staff resources to operate a 24/7 VRS and answer all kinds of questions. Such goals might be achieved, however, if large groups of libraries collaborate to provide support for virtual reference. This means that a collaborative virtual reference service (CVRS) would allow libraries not only to increase their hours of service, but also to share experiences and exchange knowledge with one another (Jin 2005).

The development of Virtual reference services have begun by establishing library websites of their own. It should be noted that, Library website is a mandatory for providing this sort of virtual reference services to the users. Hence, it does not necessarily mean that, the librarians have to design or develop library websites, but they can outsource for designing the website, but the content should be of librarian's domain as librarians are content managers.

3.0 Characteristics and Methods of Virtual Reference Services

The characteristics of Virtual reference services are found via electronic mail and some of these catalogues enabled the remote users to ask their questions through links which allowed the request of a document consultation. As the Ask-A-Scientist and Ask-A-Volcanologist, the Ask a Librarian service has been on the Internet for some years and it is easy to be accessed. The libraries reference departments establish that service as a link in the library home page, allowing a great increase in the number of consultations. On the Internet, one can find many libraries which offer reference services in real time via access to database, telephone, e-mail, Web form, videoconference, “Internet chat”, FAQs and Mural pages. Some of the Virtual reference services rendered in academic and research libraries in the Indian context are shown in the following screenshots.

URL: http://library.tiss.edu/
E-Mail and Live Chat are the best means of rendering Virtual reference Services. Librarians can establish a virtual reference service with relatively little expense or technical expertise for extending virtual reference services using Instant Messaging tools like Google Talk or Yahoo Messenger etc. In India, Question Point service from OCLC, USA has been rendered as ‘ASK a Librarian’ in which three universities in India have been part of Question Point Project i.e. Delhi University, Delhi (www.crl.du.ac.in); Tata Institute of Social Sciences, Mumbai (www.tiss.edu) and Gulbarga University, Gulbarga (www.guglibrary.net). QuestionPoint is a unique virtual reference service, supported by global network of cooperating libraries worldwide, as well as an infrastructure of software tools and communications. It is not necessary that, one should apt for OCLC only rather the libraries can have this sort of virtual reference by creating a link at their respective library website either by means of e-mail/chat/phone using the net applications (Gaddagimath and Jange, 2011).

QuestionPoint is a unique virtual reference service, supported by global network of cooperating libraries worldwide, as well as an infrastructure of software tools and communications. QuestionPoint is also a source of unique centralized knowledge resources built by a collaborative network of member libraries. It is a 24/7 web enabled virtual reference tool and services utilized by many libraries in incorporating Virtual reference Services in their respective libraries and a sample of such service used in Gulbarga University Library @ www.guglibrary.net is shown below.

4.0 Marketing Virtual Reference Services (VRS)

Some of the tips to market Virtual Reference Services are mentioned below (http://www.ssdesign.com/librarypr/content/p070802a.shtml).

1. Treat your online services like a branch library.

Support them with appropriate budget and staffing for both developing and marketing “the product.”
2. Have a communications plan.
   This plan should complement and extend your library's overall marketing plan. The look, tone and voice should be consistent with the image of library and assign a coordinator to manage and carry out the plan.

3. Don't forget most important audience
   The most important audience when launching any new service is staff. All frontline staff need to be up to speed, know the URL and be able to answer questions.

4. Remember Unique
   The launch of a VRS is newsworthy because it is new and unique to libraries.

5. Focus on what's unique
   Online reference and other virtual services provide an opportunity to focus on what people say they like best about libraries - the expert, personalized service that librarians provide.

6. Have a clear and consistent message

7. Harness the power of word-of-mouth marketing to encourage Friends and trustees to spread the word.

8. Track positive feedback at regular intervals and evaluate for further improvement.

5.0 Conclusion
   All along the reference service has been a part and parcel of all types of libraries. Reference service is rendered by the reference librarians in various types of libraries in a more traditional way. According to fourth law of library science 'Save the time of reader', the
technological developments have paved the way to librarians to take the reference service to the user community wherever they are at any time. The principles and characteristics of reference service will remain the same irrespective of the reference service provided physically or virtually. In case of virtual reference service, the librarian should have the penchant for knowledge, the latest information sources that are available, developments in information communication technology in delivering the service, possess good communication skills and public relations.

The virtual reference service can be set up in all types of libraries using the available hardware and software with minimum expenditure to satisfy the information requirements of the user community. To make the virtual references service a success, the virtual reference librarian should be holding a senior position and possess thorough knowledge about the organization and the information needs of the users.

Running an Academic Library in the Changed Environment: A Study in the Backdrop of CSSSC Library System

Siddhartha Shankar Ray
Centre for Studies in Social Sciences, Calcutta
e-mail: sidsray@gmail.com

Abstract: During the last few decades, libraries are subjected to most significant changes which demanded a thorough overhauling of the entire management system for running a library. The present article narrates the compelling necessities of such overhauling/refinement in the backdrop of a busy academic-cum research Library in the field of Social Sciences located in the city of Calcutta. The Library system of the particular institute comprises a Library (of general nature), an Archive and a Resource Centre holding textual as well as non-textual materials in various formats. It is presumed that the particular Library system through its above three organs represents the totality of a state-of-the-art library system. The intrinsic idea of the discourse is to focus on certain issues which call for several debates and warrants new thoughts to deal with the complexities in the management of a Library in the present phase of time when both electronic and printed materials do co-exist and users use to (and some time need to) roam through both the forms simultaneously. Scanners and Photocopiers, pen and laptops, notebooks and 'pen-drives' peacefully coexist and academic flavour of Librarianship is gradually being replaced by the service of a new generation of highly computer skilled professionals as the situation demands. Knowledge base and expertise are two important factors in rendering requisite service in a Library. The new age Hybrid Libraries and the newly realized demands for requisite manpower to fit-in, is quite an important issue which the article attempts to address. Basic philosophy of human resource management in general, and precisely, the concept of manpower development in libraries have undergone a sea-change during last couple of decades. Outsourcing and its inherent impacts in ways of service potentiality, motivation and commitment are also addressed in the article to explore ways to sustain the sanctity of a Library as a technological service sector in this turbulent phase of time.

Introduction

In the age of Information explosion and cybernetics, Libraries are by far the most significantly affected area in the academic community.

'Books' as the main ingredient of the first of the famous five laws of librarianship Books are for Use have undergone so significant transformations in form, format, nature and style that the second law Every Reader his/her Book creates a baffling impact on people. Especially coexisting of orthodox as well as state-of-the-art materials have made the situation even more complicated. Arguably, however, some can claim that the nuance has become quite simplified with the introduction of electronic devices but while the existence of 'book' as an entity in our perceived idea plain has been so drastically re-incarnated that it has become difficult to conceptualize a book in its traditional format as a source material. It is needless to say that this transformation of books from its traditional traits as a sequential cluster of printed pages bound together to what we call as meta documents has ushered a sea-change in maintenance of a present day library. Never-the-less, the nature and types of personnel required for libraries has also undergone a major change.
In fact most of the academic and research Libraries are thus **hybrid** in nature having a combination of resources comprising hard and soft copy materials. There coexist catalogue cards in the cabinets and OPAC in the computers for readers' usage. Carrels are there with Monitors and key boards to access e-books and e-journals while latest issues of hard copy journals are displayed in the Journal cabinets and printed books are kept in stacks fitted with labels of subjects and Class numbers over them.

It is quite difficult to run a library without staff those are book oriented; while it is virtually impossible to imagine a library functioning without staff well skilled in Computer and ICT. In a situation when funds are being shrunked, imposing restrictions on recruitment, asking for hiring staff on contract, retaining motivation of staff and making long range plans for libraries has become extremely difficult and challenging. At the same time the nature of clients, especially, their requirements, expectations and perceptions towards a library has been drastically transformed. Technological advancements in knowledge production, thus, changed the concept of knowledge management to a great extent. The CSSSC Library System with its three wings holds materials of diverse nature. Maintenance of the respective wings in the perspective of housekeeping and services are described below.

**The Hybrid Library in the backdrop of CSSSC Library System:**

The CSSSC Library system is a part of the institution Centre for Studies in Social Sciences, Calcutta, an institute under the aegis of Indian Council of Social Science Research. The main purpose of the Library and its wings is to serve the in-house users; however, many of its services are extended to outsiders as well. Most importantly, no membership charges are levied to such outside users.

The CSSSC Library system comprises the following three wings:

- The Main Library
- The Archive
- The Resource Centre

The CSSSC Main Library is like any other special library attached to institutions of Research and higher learning. The collection includes books & journals both in hard and soft copies as well as in e-form and e-databases. Being a social science library it also includes a considerable collection of Government Reports and statistical materials as well as statistical databases. The user community, especially, those from outside, is quite diverse in nature which generally distinctly differs from other academic/research libraries especially those attached with scientific institutions in the following respects:

- The outside users constitute over 83% of the total user base. That means majority of CSSSC Library clients are outsiders. This particular aspect makes this library distinctly different from other academic/research libraries and its impact is reflected in the collection development as well as house keeping processes of the Library.
- The user base itself is quite diverse in nature which, by and large constitute people from Research/Academia, Press and Media, NGOs, Govt Departments, Legislators and Freelancers. Importantly, a considerable number of such users are from outside the city/state and often from foreign countries. This unique variance in the nature of clientele naturally demands a diverse range in the nature of collection and service modalities because
- A good number of such users are not necessarily Social Science professionals by way of formal academic training and many of them are not always conversant either with
the possible sources or electronic media/soft copies or both; asking for additional inputs from the Library personnel.

It is need to explain that to serve these community (especially, when they constitute most of the user base) some unique skills beyond formal training in Librarianship becomes a compelling necessity. Many of these users are not at all familiar with database searching and the Boolean logics. To serve such people, a strong interpersonal communication skill as well as sound knowledge of the resources and reference sources becomes prerequisite.

The collection development process at CSSSC Library as the need of the hour has been envisaged from the start of the present millennium & accommodating soft copies started then on. Taking stock of the situation after a decade reveals justification of such shifting as the users’ demand and expectations have become more intense because machines started replacing manual labour. For instance, tedious browsing of card catalogues replaced by the introduction of OPAC or book and document databases. It also enables readers quick and easy search for books. The OPAC also helps reader to do key word and text word based searches simultaneously which also enhances exhaustivity of search. It is worth mentioning that with the advent of such computerizations, (of cataloguing, for instance) the traditional modes of catalogue card preparation have been significantly modified. Like (a) cards for added entries are no longer prepared and all the authors are accommodated in the main entry itself and (b) key words are used as subject heading terms. Once accustomed with such databases, users often demand more relevant key words and easier searching mechanisms (as revealed from their feedback) which require (a) very good knowledge librarianship, (b) a good background of (Social Science) subjects and high level skill in Computer. At CSSSC Library recruitment of staff in library has been based upon this principle. Maintenance and upkeeping of delicate and oversize materials (like maps and atlases) is another complex activity.

The Archives collect old materials and CSSSC Archive has a unique collection of old Bengali Periodicals in microfilm and digital format. Needless to say that these materials are available in printed format and they were scanned and digitized (in tif format initially). Here maintaining of some requisite standard are prerequisite (The CSSSC Archive maintains Z39.50 for Meta data) Besides, the clarity maintenance is also an important issue (like CSSSC Archive maintains at least 400+ DPI for Newspapers and 600+ DPI for image materials). In order to make the digital materials searchable, the text files need to run in the back end and the image files in the front end. An extremely sound and advanced level of computer skill is required for this purpose. As such, it is well understood that in a modern day Library, how highly skilled Technical Manpower beyond Library professionals have become mandatory.

Accommodating such people in the Library and utilizing them effectively is a daunting task as supervisors need to be well conversant with state-of-the-art technologies. People with only formal training in Librarianship often observed to be too inadequate and Computer professionals too, in no way fill in the gaps. The Archive has an extremely rich collection of visual materials in digital form. Retaining the actual colour of the original materials has been a daunting challenge all through. Clustering and classifying such materials require both high level of artistic sense and a thorough knowledge of indexing and context vocabulary. These issues are common for any archive at present.

The CSSSC Library System also includes a resource Centre where vernaculars, old and rare books, old News Papers and personal collections of people are housed. Maintenance of old materials in frequently usable and accessible conditions, safety and security of rare materials
and personal collection are really complex phenomena. For example, some sorts of standardizations are found to be prerequisite for transliteration of Indic names and abundant use of diacritical marks in vernacular books which are quite difficult to ascertain without a good level of both subject expertise and cataloguing! Upkeeping and handling of hard copies of old newspapers is another critical issue. Maintenance of individual collections parallely with purchased materials is also an important issue from the perspective of technical processing.

**Discussions**

As highlighted above, the libraries in the transitional phase are rather hybrid in nature. Completely digitized or entirely manual libraries are quite exception. This combination of forms makes management tough and complex. Proper infrastructural requirements have become a prequisite. It is a fact that electronic materials are more accurate and cheaper than the printed materials to access, store and maintain but regular upgradation of infrastructural requirements are always necessary to smooth access of such e-resources. With regular curtailment of allocated budget towards maintenance heads have crippled many libraries. Orientation of staff towards new technologies is another important factor which too requires additional outlay which is not always available. Many institutes do not have such provisions at all! Contractual staffs are naturally quite mobile in nature and the ethos of commitment and motivation are virtually literary and philosophical jargons to them. If a staff is not sure about his/her stability in a particular organization, one should never expect commitment and motivation from them. Libraries as *growing organism* often need long range planning which is not at all possible with such mobile staff. Libraries are basically applied academic divisions of institutions. Staff of a Library needs to be academic minded which not necessarily be degree oriented; rather they need to have at least some nodding knowledge of the subjects they regularly deal with. They must know the resources to render reference or user support services. Users in academic libraries often need guidance as they are not always conversant with requisite sources and resources. However, it is a bare fact that majority of the professionals especially the new age people are more techno-savvy than academically enriched. Fast erosion of academic flavour in the nature of Library professional is also a big concern at this changed environment as the sanctity of a Library depends upon this aspect.

Technological advancement in the nature of e-resources often demands regular updating of knowledge base of the staff. Insufficient funds and administrative constrains of various sorts is a big hindrance in this regards. Feasibility of expenditure towards imparting trainings for contractual staff is a rather debatable issue in the perspective of cost-benefit factor because of their mobility and stability.

**Conclusion**

Libraries in this age are passing through a transitional phase at this changed environment. A new genre of technologically sound people has made their presence felt. It is the need of the hour to nurture them for future course of knowledge management. A sense of security needs to be created among deserving professionals as they are potential human resources for the Libraries. A good blend of academically strong and technologically sound library professionals is extremely necessary. Provisions should be made to retain, motivate and inspire well trained academic minded professionals. Housekeeping and collection development processes should be so adjusted that users of all walks of life feel ease in using the resources.
Adoption of new technologies is mandatory to run a library. As perceived from the needs of the users, it is expected that printed documents will stay along with e-materials as it has some distinct advantages over the e-materials. Management of Libraries needs to be planned keeping this fact in mind. However, for archival purpose, digitization of resources and creation of in-house repository is a must. Maintenance of proper standardization of such digital materials should be made. Quantum of open source materials is supposed to increase substantially in the years to come. Planning of the Libraries should be made in consultation with Researchers/Academicians for acquiring these materials especially to curtail a portion of expenditure incurred for collection development. A trend of decreasing footfalls in Libraries is observed. This is a matter of extreme concern. Users should be consulted in regular intervals to understand areas of services that can be innovatively initiated because boastful and glamorous nomenclatures like Knowledge Management or Information Support Centres actually will not be of much help in actual sense to retain the sanctity and even existence of a Library where readers are scarce.
Content Management Systems: An Experience of In-house Developed CMS for BARC Library Portals

Rajiv Gupta\(^1\), L. A. Kanal\(^2\), Ajith Balan\(^3\), S.K. Singh\(^4\) and Manoj Singh\(^5\)

Scientific Information Resource Division

E-mail: rgupta@barc.gov.in

Abstract: Websites are designed to convey and communicate information about various institution’s activities or services. A website is made up of a number of web pages, each web page containing informative content that is thought to be useful to its readers. In order to maintain consistency in nomenclature across the website, content challenges of content management are of vital importance. This paper is an attempt to discuss Content Management Systems (CMS) for well defined, visibly developed, up-to-date library website that not only offers services but enhances scholarly communication, research and educational activities among the patrons of the library. The innermost task played by the CMS is managing the content of a website. This article discusses Content Management Systems, its implementation, life cycle, issues and challenges for developing research organisation’s website with special emphasis on in-house developed CMS experience and its successful implementation by BARC library for its portals.

Keywords: CMS, Website; web page; HTML; PHP; Digital content

1. Introduction

A website is made up of number of web pages, each web page containing informative content that is thought to be useful to its readers. In order to maintain consistency in nomenclature across the website content challenges of content management are of vital importance. A main appeal of the content management system for us was its ease of use. Content Management Systems have become one of the Internet’s most powerful web developer tools. Library portals need to be updated faster and are an easier way to cater information needs of its users. There are various CMS’s available from small to enterprise level. Some of them are open source and some are commercial. One has to choose the right one as per the requirement and need.

Every library is setting up their own website to serve their patrons. A library webmaster has to try his level best for timely dissemination of information about library activities and services through library websites. Creation and maintenance of dynamic website content makes an enormous challenge before information professionals and library authorities. Compared with the traditional website development, content management systems are truly feasible in terms of functionality, cost and maintenance. The main reason for using a CMS is for creating, editing of content and simple & easy deployment.

2. What is a CMS?

A Content Management System (CMS) is a web application that uses a database (eg. MySQL) or other methods to create, edit, and store HTML content in a suitable system. With the help of database, one can organize and access all types of digital resources including images, graphics, animation, sound, video or text. Content is created and edited on the web in
an administration portion of the web application (back end). The resulting content is then displayed to the library users on the library web portals. Once setup and properly configured, creating and editing content is very easy and does not require knowledge of HTML or other web editing skills. In other words a content management system is a software that keeps track of every piece of content on website. Content can be simple text, images, music files, video files, documents, or just about anything one can think. A major advantage of using a CMS is that it requires almost no technical skills or knowledge to manage and update web content.

![Figure 1. Structure of a content management system](image)

3. Need for Content Management System (CMS)

There are several favorable reasons for using a Content Management System. In present digital world, CMS are very much necessary for every research organization’s library to maintain their web portals easily and efficiently. It is a pre-requisite for the design/creation of basic library websites in present time. CMS helps IT team of a library to manage each section of library website with or without knowledge of server side programming. It also helps the users to browse, retrieve and download the updated library resources quickly. CMS is needed, when there are lot of information resources available with a wide complexity in them. It is essential in a library portal when the amount of changes in the content or design are large and frequent. CMS is required to create a number of publications from the existing available content. It is very much essential for presenting qualitative and accurate information to the users. Since information is changing rapidly, content management is crucial for accessing the required digital information.

2. Functional Workflow of Digital Content through CM Software:

In a functional workflow during creation of digital content, the first step is authoring,
that includes creating and reviewing of content by different users. The second step includes storing of the created and reviewed content in the workflow. The third step includes publishing the reviewed content in a logical output format according to the local needs. After publishing the website the CMS automatically archives the content and also disposes off the obsolete content from the database. Fig. 2 shows the graphical representation of content creation life-cycle and functional workflow from its origin that starts from selection of data from different sources of information available in universe of knowledge. It also depicts the processing of the content through a CMS for different web pages for library web portals. After publishing content in the digital form, some of the useful processed information is archived and outdated information is flushed out from the system.

5. Criteria for Choosing a Open-source or a Proprietary CMS:
Choosing a CMS between open source and proprietary (commercial) is a difficult task. There are various commercial options for ‘Content Management Systems’, all available globally. Depending upon the requirements, one has to choose CMS that is ideal for the organisation’s website. The person should have a clear vision before selecting a CMS for his/her institutional/library website. Here are some basic points listed for selecting a CMS:

- CMS should have content administration through its database and it should be platform independent.
- CMS should allow archiving feature and version control.
- It should also allow customization and integration with existing system.
- CMS should accommodate all types of content.
- While choosing an appropriate CMS, one should keep the library audience in mind.
- Cost is also one of the major factors that is needed to be taken care of while selecting a commercial CMS.
- Training, support & warranty is very important. The vendor should provide regular support & updates of software during the warranty period.
- Proper customization should also be provided by the vendor as per the local needs.

6. CMS Development Perspectives & Implementation at BARC Library:
Scientific Information Resource Division (SIRD) has developed an in-house CMS to update various sections of BARC website (bilingual), Intranet Saraswati and Digital Information gateway Lakshya.

SIRD maintains BARC website and other SIRD intranet portals. BARC website has about 15 sections and 26 sub-sections which are updated from time to time. Some sections need to be updated on daily basis also. Screen shots in Fig. 3 & 4 shows some daily & frequently updated sections which include Tenders, Symposia, Recruitment etc. in Hindi and English language. Screen shots in Fig. 5 & 6 shows in-house developed CMS for Journal Article Management for our Intranet Saraswati portal.

- Tools used for development of in-house CMS are:
  - Server Side Scripting PHP
  - Backend Database MySQL
√ Web-page designing tools  Adobe Dreamweaver, Adobe Photoshop, Microsoft FrontPage
√ Client side Scripting  Java Script, CSS etc.
7. Advantages of Our In-house developed Content Management Software (CMS)

Content Management is integral part of SIRD managed websites and plays crucial role in sharing information through campus wide BARC InfoNet. Following are some of the advantages of our in-house developed CMS:

- User can Sign in with a user name and password.
- Providing the registered users with various access rights.
- Data output in desired available format.
- Through this CMS, information is available to anyone connected to BARC InfoNet.
- Data is secured and normalized in a database with unique multi-level data and access protection.
- Can easily keep up the statistics of the resources used.
- Content management system automatically generates XHTML according to the W3C standards with meta-tags information also.
- Multiple accesses to content resources are possible.
- Can track number of simultaneous users and their subject interests for future use.
- Automatically archiving of expired content and flushing out obsolete records from the system database.
- It contains in-built query search facility and advanced report generation system.
- Daily scheduling of data-backup can be taken through in-house developed CMS.
- Effective searching is possible to retrieve particular information from the CMS database.
- Access to content information is instant by surfing the SIRD Portals.
- Large volumes of data can be stored in CMS and made accessible to the users.
- Addition and deletion of information to the collection is faster and easier.
- Ability to upload and edit files - documents and images.

Figure 6: Inputting Screen of the in-house developed CMS for Journal Article Management
Listed above are the useful properties of the in-house CMS developed by the SIRD. Through this CMS we provide a huge variety of digital information to our patrons without time lag.

8. Popular Open Source Content Management Systems

Some popular open source CMS are listed below which can be beneficial for the users:

![Drupal](image)
![Joomla](image)
![PHP-Fusion](image)

![Wordpress](image)
![dotCMS](image)
![Plone](image)

9. Conclusion

SIRD portals are pure static in nature, but content of some sections needs updating on daily basis for which a SIRD CMS has been developed which has proven to be very helpful. The JAM-DIR is a CMS for pre-production and collection development of Journal Article Management. Both the in-housed developed CMSs are built on a modular design with reusable content. Consistency, flexibility, standardized process and designed elements have been implemented to a large extent. The benefits of implementation of local need based CMS has shown its results in terms of in-time content creation, updation and publishing. Public users and especially the library patrons have been benefited with seamless access of content created through the in-house developed CMSs.

There is no substitute for vision. Vision makes it possible to implement changes.

Abstract: The paper discusses how academic libraries could use weblog, a potential web-based application, for promoting library resources and facilities. It describes how academic library weblogs serve as interactive platform for the sharing ideas and expertise among librarians’ and users’ communities and become conducive medium to receive users’ feedback needed for continual improvement of library services. It also discusses how weblogs can be utilised in conjunction with other web-based resources such as RSS, podcasts, social tagging sites, etc. to facilitate sharing of knowledge, embedded in collective community, through collaborative mechanism. The paper cites URL of some academic libraries illustrating how weblogs are being adopted worldwide. The objective of this paper is to encourage librarians in India to resort to blogging, where the application of new web-based technologies is still in infancy. The paper suggests that weblogs, with low cost implementation, requiring least technical knowledge, can be easily introduced in academic libraries to enhance library services.

Keywords: Academic library, Blog, Library 2.0, Podcast, RSS, Web 2.0

1. Introduction

With the advent of new web-based technologies, the relationship between librarians and users’ community has been dramatically changed. Libraries striving to satisfy the new-generation-user-group, are keen to adopt new web-based technologies in managing library services and provide improved, unmediated and independent access to library collection and facilities beyond the library hours and boundary. The development of new web-based technologies has made it possible for libraries to deliver services through its websites and helps users to engage the library in two-way communication and knowledge exchange (Kim and Abbas, 2010). As website is the virtual representation of organisation to the outside world, there has been an increasing trend in every sector to potentially harness the website in promoting organisational facilities. Libraries use website to provide access to online resources, notifying new additions, news and events, informing them about library services and facilities. However, introducing the new web-based technologies, libraries are capable of providing both librarians’ initiated as well as users’ initiated functionalities. Weblog is one of the new web-based technologies that libraries have started using across the world to enhance library services and facilities. Though blogging is relatively new a phenomenon in developing countries, but with increased availability of internet and network-based technologies it has gradually been gaining popularity everywhere. Conventional way of interaction with users through leaflets, newsletters, etc. has transformed dramatically and libraries are now finding weblogs as a new and exciting media of communication. Among academic libraries weblogs are predominantly used in school libraries, as per research findings of Valenza (2007). According to King and Porter (2007) academic libraries use blog to facilitate internal communication as well as communication with the library users, promote new books and provide subject guides, current awareness and customised catalogue search facilities.
2. Weblog - A Brief Overview

A weblog, as the name suggests, is a 'log on the web' and 'log of the web' (Kim and Abbas, 2010). Weblog or blog is a particular class of website, updated frequently and intended to general public consumption. A blog containing brief entries displayed in reverse chronological order. Creation of blog does not require any specialised technical skill; it even does not require the knowledge of HTML. Blogs are platform independent and can be accessed from anywhere at anytime. A blogging software, most of which are easily downloadable freeware, will help anyone create a blog within a few minutes. Blogging software regularly refreshes the content of the home page, with the posting of new contents, automatic archiving of old posts.

A survey by Clyde (2004) reveals that among several Blogging Softwares available till 2003, the mostly used ones are Blogger (https://accounts.google.com/ServiceLogin?service=blogger&tmpl=start&hl=en_GB&passive=86400&continue=http://www.blogger.com/home#s01) 43.9%, Movable Type (http://www.movabletype.com/) 17.5%, Radio UserLand (http://radio.userland.com/) 8.7%, other identified less than 2%, each unidentified 22.8%. However, over the past few years, there has been a sharp increase in the number of blogging software used by the librarians. Blogger, LiveJournal (http://www.livejournal.com/), TypePad (http://www.typepad.com/), Movable Type, WordPress (http://wordpress.org/) and Xanga (www.xanga.com) are now found to be the mostly used blogging software for creation and maintenance of library blogs. Due to their low cost implementation, during the last few years there has been such an expansion of blogs that several searching platforms have appeared that have specialization in searching blogs, such as Technorati (http://technorati.com) and IceRocket (http://www.icerocket.com).

3. Literature Survey

Several authors have focused on how blogs can be used for enhancing library collection and services (Hane, 2001; King and Porter, 2007). While discussing about the library weblogs, it was justifiably argued by Alcock (2003) and Schwartz (2005) that these blogs not only serve as excellent means for disseminating news and information, including new acquisitions but can also be used as tools for in-house transmission of information, thus provide a valuable marketing tool, especially since most libraries are usually on limited financial resources. Goodfellow and Graham (2006) stressed on the use of blog as staff communication tool during conference and as an easiest and fastest medium to reach out maximum possible readers beyond the target audience. Bradley (2007) opined that blog is a mechanism where subject experts share their knowledge, understanding and opinion with other people based on current events. Blogs can be actively used for imparting information literacy (Nguyen, 2008) and for marketing library services (Draper & Turnage, 2008). Stuart (2010) opined that blogs have promising future that helps librarians explore all the avenues to attract users. Besides extending many other services, library blog encourages research scholars to access research tips (Tripathi & Kumar, 2010).

Blog is the most widely used web 2.0 features (Harinarayana and Raju, 2010). However, according to a survey conducted by Xu, et. al in 2009 (chart 1), on the extent of use of web 2.0 applications among 81 academic libraries in New York, blog is second most popular web 2.0 applications, next to instant messaging. The finding is in consonance with the research findings of Tripathi and Kumar (2010) (chart 2). They investigated the prevalence of web 2.0 applications among some libraries of higher educational institutes in USA, UK, Canada and Australia and also concluded that blog comes second, next to instant messaging. Though the
above mentioned investigations did not comprehensively include the entire universes of population, both the research findings unequivocally indicated the level of popularity blog enjoys among the academic library communities.

![Chart 1](image1.png)

**Chart 1**: Adoption of web 2.0 functionalities among 81 academic libraries in New York (as studied by Xu, et al., 2009)

![Chart 2](image2.png)

**Chart 2**: Prevalence of web 2.0 applications among the academic library websites in USA, UK, Canada and Australia (as examined by Tripathi and Kumar, 2010)

Blog, comprising hierarchy of texts, images and media objects, supports information gathering from sources external to the library (Chua and Goh, 2010). It also strengthens relationships among the users by providing socialising space to share information among like-minded users. Use of blogs in libraries, particularly in conjunction with other web 2.0 functionalities, encourages more active users participation and wider use of library website as potential medium of resource discovery.

### 4. Application of Weblog with Other Resources

Bog ranges from a very simple type; maintaining web diaries with new postings, to sophisticated one with search capabilities, in conjunction with other web resources such as, RSS, podcast, photograph, personalized search engine, etc.
4.1 RSS

RSS (Reach Site Syndication/Really Simple Syndication) is an XML-based format that allows users to access to frequently published and updated works. RSS is used to automatically and selectively pull in updated information by scanning a lot of webpages simultaneously. RSS in blogs help librarians to syndicate or publish updated information on various news and events, new acquisition, new publications, etc. as RSS feed (content in RSS format). Subscribed RSS feeds are automatically downloaded, collated and displayed in one place by RSS Reader (software, mostly freeware).

4.2 Podcast

A podcast is series of digital audio files, distributed over internet, and automatically downloaded through podcast's RSS feed using special software applications, known as podcatchers, most of which are freely available. At present, many libraries in higher education institution in several countries have resorted to use podcast in library blogs to market library services and develop audio books, indicating the increasing popularity and usefulness of this technology.

4.3 Instant Messaging

Instant Messaging is a real-time, synchronous conversation, between two or more people using text message via internet. Unlike e-mail, where the sender of the message have to wait for delivery of the message and an eventual reply, instant messaging works more like a telephone conversation allowing instant delivery of message. Library blog combined with instant messaging feature provides cost-effective virtual reference service and users get their queries responded immediately.

4.4 Social Tagging

Social tagging is a method of organising information. Social tagging sites like Digg (http://digg.com/), Delicious (http://www.delicious.com/), Reddit (http://www.reddit.com/), etc. help users categorise documents with keywords, save them online using tags, collocate all tags in one place on the web, and allows them to search the keywords from anywhere, at anytime they like. These sites allow users to select web feeds of tags of their area of interest so that they could see the new and preferred tags as soon as those are being saved by other users. Library blogs integrated with social tagging sites help users to use user generated tags related to the subject content of the resources to aid them better in information retrieval.

4.5 Social networking

Social networking involves technologies that offer users the chance to interact, share themselves, and create content. Online social networking sites such as MySpace (http://www.myspace.com/), Facebook (http://facebook.com/), Twitter (http://twitter.com/), LinkedIn (http://www.linkedin.com/), etc. help users the chance to create multimedia compositions like text, images, sounds, hyperlinks, etc. to express themselves through collaborative mechanisms. Social networking sites, linked to library blogs, offer library and librarians the opportunity to interact with users and provide information about library collection and services, and respond to their feedback.

4.6 Photographs and Images

Blog can be excellent repository of photographs depicting a specific event. Photographs may be directly incorporated into blog through Flickr (www.flickr.com) and Picasa Web Albums (https://accounts.google.com/ServiceLogin?hl=en_US&continue=https%3A
4.7. Videos

Dailymotion (https://www.dailymotion.com), iTunes U (https://www.apple.com/education/itunes-u/), YouTube (https://www.youtube.com) these are potential medium to deliver educational instructions to the students. Library blog may supplement classroom teaching using these audio-visual medium to reach out to the distant learners.

4.8 Personalised Search Engine

Most of the search engines retrieve too much of information against a query that searchers are often confused with information overload. In order to get better search results librarians need to personalise search engines. Those engines can be incorporated into blogs so that best possible information could be received at shortest time. There are several sources available at internet, like Rollyo (www.rollyo.com), Eurekster Swicki (http://www.eurekster.com/), etc. to build ones own search engine in blog so as to personalise subject based search from selected websites.

Besides these, blogs can include hyperlinks to other sites and allow users to find more information covering the subject area where the blog concentrates on.

5. Use of Weblogs in Academic Libraries

Library weblog provides ample opportunity for the librarians to apply creativity, to use their judgement to the fullest extent, to make library more attractive to the users. Navigation of various library blog sites may help librarians develop understanding regarding the diverse use of weblogs to improve users' services. Library blogs serve as platforms for the librarians to provide means to get connected directly to the users' community, to share their views for the betterment of library services. Moreover, library blog engages users to upload photographs of various events, participate in book reviews and most importantly form communities with social networking and social tagging sites.

Cited below are examples of some of the academic libraries where blogs have been introduced to promote library facilities and services.

5.1 Blog to Provide Current Awareness Service

Blog provides information about new additions and modifications to existing library collections and services. According to Cohen 2003, blog helps libraries to provide most up-to-date information to the users so that they will look to the library as a place of currency, and not just archives, e.g., Curtin University Library Blog (http://blogs.curtin.edu.au/library/), The Princeton University Engineering Library Blog (http://blogs.princeton.edu/englib), The University of Auckland Library Blog (http://blogs.library.auckland.ac.nz).

5.2 Blog to Announce Library News and Events

Blog serves as a medium of communication, keeping users in tunes with information relating to recent updates of current events, news of appointments, admission notifications, seminars, conferences, workshops, meeting, exhibitions, etc. Notable examples are James Cook University Library Blog (http://jculibrarynews.blogspot.com/), Carnegie Mellon Univrsity

5.3 Blog to Offer Book Reviews from Users

Blog posts favourite books and seek users' thoughts and opinions on that, entertains comments thereon, and develops reading habits in general, eg, The Grinnell College Libraries Blog (http://grinnellbookreview.blogspot.com/) and Drexel University Library Blog (http://www.library.drexel.edu/blogslisting). Drexel University Library blog has combined with other web 2.0 applications such as RSS, Facebook and Twitter to provide wider platform for the users to share their views.

5.4 Blog to Provide Research Tips:

One of the most important aspect of academic libraries, particularly libraries of higher educational institutes, to have research scholars among the users' community. Blog encourages research scholars to access research tips, e.g., Columbia University Journalism Library Blog (https://blogs.cul.columbia.edu/journalism/) and Roosevelt University Library Blog (http://rulibrary.typepad.com/roosevelt_university_libr/). Roosevelt University Library Blog encourages users to tag/index blog contents and answer reference queries of users by users themselves through instant messaging link in blog.

5.5 Blog to Promote Distant Learning

Blogs facilitates distant learning by providing online resources such as tutorials, lectures, presentations to the remote students. The service is further strengthened with the integration of other web 2.0 application such as podcast, RSS, video sharing sites, etc. For example, University of Wisconsin Law Library Blog: WisBlawg (http://www.law.wisc.edu/blogs/wisblawg/) and Kendriya Vidyalaya Pattom, Thiruvananthapuram Library Blog (http://librarykvpattom.wordpress.com). Some libraries have created subject-wise blogs to keep user stay current with subjects of interest, e.g., library blogs of Imperial College of London (http://www3.imperial.ac.uk/library/news/blogs) and Nanyang Technological University (www.ntu.edu.sg/library/collections/Pages/blogs.aspx).

5.6 Blog to Give Entertainment and Amusement for the Users

Libraries may use blog to provide entertaining and amusing news and events to users. Some library blogs, with integrated applications such as RSS, Flickr, YouTube, provide information in attractive way through photos, instructional audio and video tour of the library, eg., Harper College Library Blog (http://harperlibrary.wordpress.com/), and Duke University Library Blog (http://blogs.library.duke.edu/scholcomm/).

5.7 Blog to Receive Feedback from Users

Users are encouraged to post comments on contents through online comment links provided at the end of each of the blog-content published. Online feedback acts as a useful and lively link between the library staff and users' community and helps organise library collection and services more users centric. For example, Temple University Library Blog (http://blog.library.temple.edu/liblog/) and Case Western Reserve University Library Blog (http://blog.case.edu/orgs/ksi/news/). Besides providing comment links, the KVN library blog of Case Western Reserve University promotes socialisation among users through bookmark, networking and other facilities.
5.8 Blog to Share News and Information for the Librarians

Blog keeps librarians regularly updated with upcoming events, conference activities, valuable links with useful sites, besides providing recent developments in library field and informing hundreds of job resources for the librarians, e.g., La Trobe University Library Blog (http://www.lib.latrobe.edu.au/blog/) and Cornell University Library Blog (http://blogs.cornell.edu/).

5.9 Blog to Facilitate Conference Reporting

Blog is used to post time to time conference report, live from the floor of the conference hall, using a laptop with wireless internet connection (Goodfellow and Graham, 2007), ensuring frequent visit to the site and effective communication with widest possible audience residing far from the venue, e.g., University of Sidney Technology Library Blog (http://lrsn.blogspot.com/2011/02/university-of-technology-sydney-library.html).

6. Conceptual Model for Academic Library Weblog:

Based on our survey on 120 academic library websites in USA, UK, Australia and New Zealand and resources from published literature, we tried to develop a conceptual framework of academic library blog. It has been found that use of blog varies in different academic libraries. Inspite of being an interactive platform, blog remained library initiated functionality in many institutes. However, during the last two years the trend has changed and users’ participation and contribution to blog has now become seemingly evident as the library website matures.

Maness (2006) outlined four distinct features user originated, socially rich, multimedia enabled, and community innovative needed for a library to be designated as library 2.0. These essential features are portrayed from the viewpoint of all sorts of libraries (Xu, et., al, 2009). However, in the present study attempt was made to exhibit the concept of library 2.0 through library blog (Figure 1), integrated with other web 2.0 applications. The model may help develop a comprehensive understanding on the practicability and usability of adoption of blog in academic library.

![Figure 1: Library blog exhibiting the essential features of Library 2.0](image-url)
With the introduction of blog in academic library website, a library encourages users to actively participate in information management so that library services could be originated and supplemented from users themselves, particularly when users answer reference questions through lively links in blog, engage in debate and provide effective input in book discussion forum at blog. Blog makes library socially rich with social networking sites, linked to blogs, encourage users to share problems, discuss issues and engage in dialogue to develop a shared understanding. Thus library blog may promote community of practice. Another most vibrant feature of blog is the ability to integrate audio and video functionalities. This multimedia application is most attractive to the users receiving information in audio-visual format along with texts. The communally innovative feature of blog is evident when it allows tagging sites to embrace librarians and users together to produce innovative outcomes within the library framework Tagging or indexing a content, specially by the users with keywords of their choice is an excellent example of user initiated innovative functionality.

7. World-Wide Library Weblog Statistics

Blog is used as an important virtual space and contains valuable information like any other scholarly information channels (Harinarayana, and Raju, 2010). A search on 120 academic library websites in July 2011 revealed that approximately 46% libraries use blog, though the characteristic features of blog and purpose of using it varies from library to library.

Some of the libraries have restricted entry to blogs for the students and faculty members of that library only. Some libraries have more than one blog, each designed for specific groups of users. For example

- University of Auckland Library (http://blogs.library.auckland.ac.nz/) has 14 blogs - arts, engineering, education, law, information commons, business and economics, science, National Institute of Creative Arts and Industries, Philson Library, special collections, Tamaki Library, digital services, audiovisual library, digital developments.

- University of Queensland Library (http://www.library.uq.edu.au/services/blogsindex.html) has 10 blogs destined to different user groups - biological, science library blog, business blog, tourism and economic blog, civil engineering newsletter, Gatton and external students' blog, health sciences library services blog, Ipswich library blog, law library blog, PSE library news, Ssc and technology blog, what's new on the web.

- Charles Sturt University Library (http://www.csu.edu.au/division/library/research/blogs) has 3 blogs - your library @ csu, health and social science blog @ csu library, and endnote blog @ csu library.
Paula Hane (2001) believes that 'blogs are natural for librarian', a contemplation that is justified with the exponential growth of library blogs. Compared to introduction of library website since 1996, the inception of library blog can be traced back to mere 2003 (Clyde, 2004). During the end of 2003, the number of library blog was 50 as compared to the estimated number of publicly available weblogs being 3.4 millions (Wolff 2003). By end of July 2004, the number has grown significantly to 198, still far less compared to the number of libraries having their websites (Clyde, 2004) and to 398 by the end of 2005 (Karami & Oloumi, 2005). The figure rose to 500 by the end of 2006 (Bradley, 2007).

A search for library and library related weblogs, conducted by the end of 2007, 2008, 2009 and 2010, through following services revealed that there were 684, 961, 1520 and 3021 library related blogs respectively (chart 4):

- library and information search engines -
  - LibWorm (www.libworm.com);
  - Liszen (www.liszen.com), and
- library and information science wikis
  - LisWiki (http://liswiki.org/wiki/Main_Page)

![Chart 4: Growth of Library Blog during the last four years](image)

It has been found that the number of blogs of libraries show a sharp increase in pattern over the years emphasizing the fact that the concept of libraries have changed considerably during the last few years.

8. Use of Weblogs in Academic Libraries in India

Blog offers documents to be put up on the web and make it publicly accessible, allowing users not only to share the content but also to interact with it, through comments. Users' community now ceased to become a passive viewer and becomes co-creator of content with modifications and improvements to it.

8.1 Present Scenario

Though blogging technologies are having sharp inroads in libraries of developed countries, those are yet to have a significant acceptance in the libraries in India. Basic
infrastructural facilities, i.e., computer and communication network, required to use these technologies, are available at almost all university and college libraries. Unfortunately, there libraries in higher educational sectors, at large, are a bit skeptical to adopt these freely available new web-based technologies that require no additional fund and software knowledge to interact with users in an environment that suits most. The most plausible reason may be the digital divide among the users' community with most of the users of academic library do not have easy access to internet outside the library. However, computer still remains a distant dream for most of the school libraries, particularly those at rural areas. Still blogging techniques have found acceptance in some of the academic libraries. While blog with RSS, being the most popularly used application to enhance school library services, blog with virtual reference service through instant messaging, and blog conducting virtual library tour with Flickr photos are being used in some of the school libraries in India. Notable academic library blogs, so far, was found among a few libraries under Kendriya Vidyalaya (KV) network. There are 22 KV libraries, as per Kendriya Vidyalaya Library Blog Directory, India (http://kvlblogs.wordpress.com/) accessed in September 2011, having library blogs, incorporated with other shared web resources such as RSS, social bookmarking, social networking and instant messaging. Besides these there is no significant approach to adopt blog in academic library field in India.

8.2 Future Prospect

Library blogs can serve as excellent alternatives to promote users' services for those libraries, with limited fund and technical manpower, as the technology is available free of cost and can be easily adopted. It is equally applicable to libraries with greater infrastructural facilities and technical expertise to enhance the existing library service and continue to remain relevant in the 21st century. Using RSS service in library blog and creating RSS feeds for new addition of books will improve the acceptance of library to the users in manifold. OPAC integrated in library blog, with customised search facility, notifying users about the recent additions on their subject of interest, will ensure more users' engagement with the library.

Library may create a blog or Lens (web page) from freely available service such as Squidoo (http://www.squidoo.com/) and organise virtual exhibition, upload photographs of events and arrange for virtual library tour to introduce new users with the library, perhaps with captions and audio recording. It may encourage users to add photographs to enrich the overall library work experience and attract users in participatory involvement.

9. Conclusion

It is evident from the above discussion that blog is increasingly gaining ground as an interactive medium of information communication. But unfortunately libraries in India are lagging far behind in adopting blogging technologies in improving library services. At the advent of digital revolution, libraries need to be proactive in using new technologies such as blog to keep users virtually in constant touch with the library by providing RSS feed-based online library services. However, it depends upon the libraries to evaluate the appropriateness of using these technologies as information communication tool. As users now keen to use library collection and services beyond the library hours and physical boundary of the library, it is increasingly being felt that large number of users is going to be benefited by the successful application of blogging technologies.
Bibliography

Organisation and Services in Social Science Research Libraries with Special Reference to Institute of Development Studies Kolkata (IDSK) Library

Madhusri Ghosh and Shyam Prasad Ram
Institute of Development Studies Kolkata (IDSK), Kolkata- 700 064.
E-mail: madhusri.ghosh@gmail.com / Callshyam2025@yahoo.co.in

Abstract: Present article is a discussion about the information resources, their various formats, natures etc. of a research institute named Institute of Development Studies Kolkata, engaged in research on different socio-economic issues, the nature of generating information, organizing and management of information resources and finally disseminating to the recipient.

Keywords: Research Library, IDSK, Social Science, Library services, Library Users, Uses of Library

Introduction

The development of special libraries, essentially a product of the twentieth century. Research organizations, businesses, governmental agencies, and similar enterprises established libraries in order to centralize materials housed in individual laboratories and offices and to unify information-like activities. Special librarians are information resource experts dedicated to putting knowledge to work to attain the goals of their organizations. They are employed most frequently by corporations, private businesses, government agencies, museums, colleges, hospitals, associations and information management consulting firms. These libraries collect and store special materials in addition to others and serve the specialised requirements of specialist users in anticipation of and in response to specific demands. (Ghosh, 2001) After the Second World War importance of research in social sciences was realised by Government of India. Initially the research institutions were concentrated in New Delhi. Gradually different State Governments have taken initiatives. The field of development studies is an academic discipline since its emergence in the late twentieth century. It is perhaps best characterized as a multi-disciplinary. Most scholarly contributions come from the fields of anthropology, criminology, demography, ecology, economics, geography, history, international relations, philosophy, political science, public management, and sociology, area studies, cultural studies, epidemiology, ethnic studies, migration studies, pedagogy, postcolonialism, and women's studies. It is The study of change in developing countries.

In India there are several institutions engaged in research on development studies e.g. Centre for Development Studies established in the year 1971 by the eminent economist Professor K.N. Raj, Madras Institute of Development Studies was also established in the same year, Indira Gandhi Institute of Development Research was established in the year 1986. They specialize on social sciences with emphasis on economic development.

Institute of Development Studies Kolkata was promoted by the Government of West Bengal in the month of August 2002 as an autonomous centre of excellence in social sciences.
Institute of Development Studies Kolkata (IDSK)

IDSK was promoted by the Government of West Bengal in the month of August 2002 as an autonomous centre of excellence in social sciences. University Grants Commission (UGC) has sponsored the setting up of the Rabindranath Tagore Centre for Human Development Studies (RNTCHDS) under the auspices of the IDSK and the University of Calcutta. This Centre is conducting a number of activities.

Institute of Development Studies Kolkata (IDSK) Library:

Library started functioning since December 2002 at a class room of Calcutta University Alipore campus on the fifth floor. Initially there was only 50 documents in the library. First library personnel joined in the month of December 2002. From January 2003 Library started acquiring books journals and furniture. At the end of 2003 total number of books acquired by the library was 679. At that time books were arranged according to accession numbers. On the month of July 2010 partial documents are shifted from Alipore campus to its own premises at Salt Lake. In the new building 2500 sq feet is allotted for the library. It is distributed in two floors of the south block of the building. On the second floor book stack and back office job area is arranged. On the second floor reading and reference section, serial division, circulation division and e-library is arranged. It has open access browsing system. Users can directly go to the stack and browse the books. The library has developed single window system.

Types of collection:

Library already houses an impressive number (20,000 approximately) of books, reports, statistical databases, reference books, journals and magazines, CD ROMs, DVDs, Maps, microfilms, audio cassettes, and primary documents e.g. occasional papers, working papers, special lectures, theses and dissertations focusing on various development research like Education, Public Health, Economics, Development Studies, Demography, Sociology, Anthropology, Ethnography, Political Sciences, History, Gender Studies, Human Sciences and Globalization, eco criticism, North East India studies. The library has a notable collection of Bengali books in Rabindranath Tagore Centre for Human Development Studies.

The library also has acquired the archival documents of a project on Women and Media funded by Rosa LuxembergStiftung of Berlin which include reports, booklets, posters, pats or scroll paintings, CD ROMs, DVDs, audio cassettes, video cassettes, catalogues, transparencies and fact sheets.

Organization

Library has purchased and processing its documents with tools e.g. Dewey Decimal Classification (DDC) 22nd and 23rd edition, Anglo American Cataloguing Rules (AACR-2R), Sears list of subject headings 20th edition, C.A.Cutter's 3-figure Author table fully revised edition, American Library Association (ALA) filing rules. Library maintains an authority file.

a. Acquisition:

- Ordering: Books and journals are generally ordered by the Director, members of faculty, scholars. Here order status is monitored through a list given below. Books are also kept for approval of the library committee. In this case new books are displayed in the library for a period of two weeks and the users select them and finally library committee approves them. The library acquires single copy of book according to the policy of the authority. Incase of M. Phil courses more than one copy is purchased in the library.
• Gifted collection: The Institute has been gifted with very valuable collections, that of the late Michael Sprinker, a leading radical literary theorist, Shri Gopal Krishna Gandhi, Governor of West Bengal and also a collection of books from Shri Parimal Dasgupta, a leading journalist, and by the Director Professor Amiya Kumar Bagchi. These documents are designated as Michael Sprinker collection, Gopal Krishna Gandhi collection, Parimal Dasgupta Collection, Amiya Kumar Bagchi Collection. Gifted books are organised and kept in an apartment at Beliaghata. At present the Institute has acquired 5000 valuable gifted books.

• Collection received through exchange programme: Library has established network with 78 institutes e.g. Centre of Development Studies Kerala, Madras Institute of Development Studies, Centre for Studies in Social Sciences, Asiatic Society, Institute of Economic Growth, etc. and exchange the publication of the institute with them. A huge number of are acquired through exchange programme.

b. Accessioning:
It is done manually on the accession register. For separate collections e.g. for IDS\$K collection, gifted books and Rabindranath Tagore Centre for Human Development Studies collection etc. different accession registers are maintained. Initial letters are incorporated for gifted books and Rabindranath Tagore Centre for Human Development Studies collection, e.g. for gifted books G200 is the accession number. Library has taken decision that page number 31 as the hidden page.

c. Classification:
Since August 2003 (after purchasing of DDC 22nd edition) the books were classification of books started. Call number of a book is described below:

Libraries and librarianship in India/Jashu Patel and Krishan Kumar
020.954P27
020.954 class number from DDC 22nd ed.
P27 is the Cutter number
P is the initial letter of the title.

d. Cataloguing:
First level of description according to AACR2(R) is given in the catalogue. A decision has been taken for maintaining alternative subject headings. Till the end of 2007 only manual catalogue service was given to the users. From January 2008 Software for University Libraries (Soul college version) was purchased in the library and along with manual entry computer was started in a machine provided by the authority. Now at SaltLake campus Institute has given 9 machines. After consulting with Dr. Soumitra Sarkar Chief Librarian of Calcutta University local area networking is done 9 nine machines. Users are able to browse the OPAC in the library. Library is planning for Web OPAC and an arrangement is done and it will be launched in its new website on 26th September 2011. There is no pending books for processing. Only bound volume journal which are kept still in Alipore are not yet processed.

e. Circulation:
Previously manual charging discharging was done before sifting at its new campus. Brown charging system was followed in the library at that time. Now issuing of books are done by using SOUL software. An issue register is also maintained in the library. It helps to calculate use statistics.
Users

Users can be categorised as:

- Activist
- Doctoral Research Fellow
- Faculty
- Governing Body
- Institutional
- M Phil Student
- Outside
- Post Doctoral Research Fellow
- Research Assistant
- Research Coordinator
- Social scientists
- Staff

Uses of IDSK Library

363 numbers of users are using the library since 2003. From its beginning, 1000 nos. (approximately) of books and monographs are issued and used by the members every years. The library is extending the service to outside research scholars, faculty members and number of outside members who are getting only reading facilities are 212. Many visitors from India and outside India are visiting regularly in the library. Also keep contacts over telephone and e-mail. Internal members are provided with one reading card and one issue card. External members get only reading card. Student members can issue a book for a week. Because the library has limited collection and less number of multiple copies. But they can issue more than one copy of course materials. A student member can re-issue or reserve a book.

The faculty members can issue more than one book at a time for a month. Research scholars can issue two books at a time for two weeks. Reminder is given to the users at regular interval for book return. But no fine collection measures have been taken by the authority. During release a no dues certificate provided to the users from the library authority.

Journal Section

Library subscribing both printed and online journals. The foreign journal subscription is done through vendors. The Indian Journals are subscribed directly. The printed copies are managed through cardex. As and when journals are received it is entered in the cards. Regularly claims monitoring notices are sent to vendors and publishers.

IDSK library subscribing 78 nos. of foreign journals out of which 48 nos. are printed, 26 nos. are online and 4 nos. are both printed and online. IDSK Library also subscribing 36 nos. of Indian journal out of which 32 nos. is printed and 4 nos. are both printed and online.

Library also acquiring 19 nos. of journals as a gift from different organization.

E journals are available through Delnet. A member can send a specific request through library to Delnet. Calcutta University has given one access point for browsing and
downloading full text articles at our another campus in Calcutta University, Alipur campus. Being a member of AIRC and ISI the user of IDSK library can visit them and browse journals there.

**Inter Library loan**

Library is the institutional member of Centre for Studies in Social Sciences, National Library, American Information resource Centre, Indian Statistical Institute Kolkata, Delnet and issue books from them regularly

**Library Services**

Library gives following services to the users:

- **Career guidance:** This service is given to the M.Phil students. Advertisement of job vacancy, scholarships, seminars, conferences, course works, awareness programme of other institutions are time to time extracted from internet, newspapers, magazines and displayed in the notice board.
- **Current awareness service:** The content pages of the journals received in a week are listed and circulated to the users over email.
- **Document delivery service:** Library allows up to 30% of a document for photocopying. Outside members are not eligible for getting photocopying service.
- **New arrival service:** New titles of books which are received by the library are listed and circulated to the users over email.
- **Selective Dissemination of Information Service:** This service is mainly given to research scholars and M.Phil students through email.
- **User induction:** Power point presentation about the resources of library is given to the users.

**Problems and Solutions in IDSK Library**

Problems faced in IT adoption included, inadequacy of funds, shortage of IT skilled manpower, difficulties in periodic up-gradation of infrastructural facilities, frequent change and advancement of technology, high hardware and software costs, insufficient training of professionals and absence of hands-on training. When further asked about possible solutions to the different problems in IT applications the following were suggested:

- Reengineering/revamping of existing library and information systems,
- Drastic restructuring of library and information science education for better manpower,
- More funds,
- Creating awareness among users about modern equipments and automated services, contract with networking agency,
- Annual maintenance contract (AMC) for hardware and software installations,
- More and better training programmes and
- Assistance from computer professional colleagues.

**Conclusion**

Users are the best judge to assess the information facilities and services in IDSK Library. Librarians may adopt an ideal stand even on those issues where the users have a poor
opinion. Therefore, there is need to take into account the feedback of the users in various categories to have a realistic assessment of the status of information facilities available and information services rendered by IDSK libraries.

Marketing of Library and Information Products and Services (LIPS): Demand for Globalized Era

Kanchan Kamila and Biswajit Das
The University of Burdwan
E-mail: drkanchankamila002@gmail.com, biswajit@myself.com

Abstract: This paper depicts the definition of marketing, importance of information marketing, marketing functions and activities in library services, library and information centres marketing aspects and their promotion, professional skills required for marketing of LIPS, barriers in marketing of LIPS and concludes that the Librarian need to develop an in-depth knowledge of models, theories and processes to market reference and information services effectively. Additionally, the librarians must acquaint with the necessary qualifications to present them before the user community as information managers. They are supposed to be expert in the marketing concepts in order to place themselves as information marketers rather than information providers.

Keywords: Product, Price, Promotion, Place, Library and Information Products and Services (LIPS)

1. Introduction

1.1. Nature of New Generation Users

Today's generation of students, scholars and teachers are not the same generation which used to take notes from black board, worked on Windows 98, or spent their time quietly in the reading rooms of a library. Now they read and download books and articles from Internet, burn DVDs and search google for getting information. They constitute a new breed, the leading age of a generation that promises to be the richest and savviest ever. They drive sport cars not scooters. They are technophiles not technophobes. They fax, phone, e-mail and chat online with their friends. Call them Generation next, Generation Y or Dotcommers, they are the cool, coddled, confident broods of yesterday's techno savvy flag bearers of the society.

1.2. Why LICs Go for Information Marketing

The libraries, since their inceptions are considered as main source of information. The main objective of the library is to cater the informational needs of the patrons.

The causes behind marketing of library products and services:

(i) The young generation users are the biggest challenge in front of most of libraries around the globe. Users are now customers. As the new generation users demand are being changed so libraries must understand what they want.

(ii) The emergence of information in electronic form has changed the scenario.

(iii) The competition among various publishers for obtaining big piece of cake, the increasing accountability and shrinking budget of libraries has made the position grimmer.
Now for their survival, libraries need to overcome the situation and promote its services and products. It is very much clear now that only a satisfied user will come again in the library and this is possible only if the users are aware about the services and products of the library and for making the users aware, libraries need to promote and market its services and products.

2. Definitional Analysis of Marketing

According to Philip Kotler (1994), great marketing management scientist defines that “marketing is the process of planning executing the conception, pricing, promotion, and distribution of goods, services and ideas to create exchanges with target groups that satisfy customer and organizational objectives”.

Recently, Kotler (2000) has defined marketing as “a social process by which individuals and groups obtain what they need and want through creating, offering, and freely exchanging products and services of value to others”.

3. Importance of Marketing in Libraries

The market plan is the actual process which will establish the library's business goals and objectives and figure out how to achieve them. The marketing plan is the tool which will ensure that the library services and products are viewed in a focused and clear way (Nicholas, 1998). The type and size of the library hardly matters but the users must know their library’s services and products. Marketing of information sources are needed to create demand for the products and services. The increase in the demand for the library services leads to increase the image and status of the particular library. Marketing promotes the use of available resources and products of the library. It is not required that the librarian should be a marketing manager. The university librarian with some basic marketing and good communication skills, good public relations with the university authority, heads of teaching departments, faculty members and students can take the benefits of marketing. The library and information centres can take the benefits of marketing techniques in the following ways:

- Develop new services
- Modify and improve existing services
- Satisfy users in a better way
- Improve organizational status
- Improve the image of the library among its well wishers and authorities
- Improve the performance of the library

In addition to the above benefits, a librarian who apply marketing techniques in a better way feel satisfaction from his/her heart and he/she is well recognized among the users community as well as among library profession community.

4. Marketing Functions and Activities in Library Services

Although, libraries have been ignored in much of the marketing literature and information marketing is still in a state of infancy particularly in academic libraries but marketing activities can be applied in library and information services. There are basically four key business concepts (Shapiro, 1981), that provide the basis for marketing thought and action in the non-profit environment. These are:

- The self-interest aspect of the transaction or exchange, in which both the buyer and the seller believe they are receiving greater value than they are giving up.
The marketing task, which stresses the importance of satisfying customer needs. However, the typical non-profit organization operates in a more complex manner than a profit-oriented organization. The non-profit organization has two constituencies: a client to whom to provide goods or services, and donors from whom it receives resources. The non-profit dual consistency makes the marketing task more complex, since there are two different consumers to satisfy.

The marketing mix, the elements or tasks used in marketing, usually referred to as four Ps, i.e. product, price, promotion and place.

Marketing that may help to improve the image of the library and information profession through collection of revenue performing different services to users.

Above concepts can be incorporated for information marketing also. Raina (1995) has suggested following needs for marketing of library products and services.

- Information is a powerful tool for developments and shall have due importance for all the societies.
- Information technology has immense value for handling the knowledge of the world as a whole.
- Increasing resource constraints particularly financial resources are a big difficulty to obtain by government support only.
- Inadequate resources utilization resources in terms of knowledge available with libraries if opened to the public in general can be utilized fully.
- Increasing cost of information and IT which can be managed only through the finance generated through marketing.

Accordingly, today's library professionals need to undertake market research and market planning to implement library and information services targeted to a well-defined segmented market. Although, the concept of information marketing as a discipline is new for some under-developed countries, it is a well discussed subject in developed such as the USA, Canada, and United Kingdom. Some librarians and information professionals have consciously practiced marketing principles and strategies at their work place. Strategies such as market research and market segmentation are well established marketing principles. Most library, provide these services without any conscious knowledge of marketing principles (Kotler, 1985). Ultimately, marketing approach aims at determining the needs, wants and demands of the target clients though designing and delivering appropriate products and the services, more effectively than competitors so as to achieve the library goals.

6. Promotion of Library Products and Services

Library websites are the most preferable tool for marketing library and information products. These have the potential to enhance services for users (Abraham, 2001), act as a first point of contact for new customers (Brewerton, 2002) and act as a promotional tool in the process. They can also be used to showcase research and resources (Traister, 2003) and generate new resources (Jay and Webber, 2004). However, to successfully achieve this goal library websites should be accessible, easy to navigate and easily searchable (Ould and Burton, 2005).

Perks such as twenty-four access to certain services and virtual tours of facilities to encourage users to visit the library's physical space are just two examples of the impact of the Web on library services in general. Such benefits can also be extended to special
collections/local studies facilities. Informational sites can be beneficial as finding aids, but if poorly constructed can result in the production of an inferior resource of little use for either locating or promoting collections.

Online finding aids and catalogues in particular, have a role to play in both the marketing of special collections (Gray, 2005) and in increasing their accessibility to a wider audience (Allen, 2003; Gray, 2005; Srivastava, 2004), Attar (2003) mentions the benefits of an electronic catalogue “as the provision of multiple access points to records, increased speed and precision of searching, and the ability to search from anywhere in the world”. Saunders (1994) agrees that the digitization of catalogues has increased the speed of searching but contents the issue of greater access, arguing that as the theory behind cataloguing has not really changed the process of access effectively remains unaltered.

The benefits of retro-conversion projects of transferring physical catalogue records onto electronic systems seem to be widely accepted in the world of special collections librarianship (Attar, 2003; Bengston, 2001). However, the great cost of skilled labour required for such projects (Attar, 2003) is a barrier that needs to be negotiated, particularly in public libraries where excessive costs of cataloguing and maintenance may be seen as outweighing the benefits of a resource (Bengston, 2001). Besides, the online tools e-mail and web could be exploited for promotional purposes as under:

(i) E-mail, Instant Messaging and Online Enquiries: E-mail and Instant Messaging are now the most common form of enquiry received by libraries. The benefits of e-mail and online enquiry forms are the speed and reliability with which an enquiry can be made from anywhere in the world in comparison with traditional “snail-mail,” as well as the increased access to information for those who are unable to visit the physical library (Jay and Webber, 2004). However, the increased speed and ease of e-correspondence can lead to a vastly increased numbers of enquiries that have to be answered by a finite number of staff, and a heightened level of expectation regarding the length of time taken to respond (Reid, 2003). This can place undue pressure on staff, particularly in local studies libraries where enquiries regarding genealogy or local history may be complex and require the searching of numerous non-digitized resources.

(ii) Bulletin/Discussion Boards: The use of bulletin boards on a local studies website can be used to encourage researchers to make contact with each other and develop debate about collections and other relevant subjects. Fitcher (2005) lists many forms of e-collaboration now available on the web, and this collaborative ethos is one that could be successfully fostered amongst collections users to create online communities and to help to encourage the engagement of non-users by exploiting a medium that is not traditionally associated with local studies.

(iii) Weblogs: Weblogs or the blogs are the sites that capture particular views, ideas, or opinions over the time. These are the web applications, which contain periodic posts on a common web page and just treated as a form of online diary. Each blog tells a story, be it about a person, an organization, an event, or any other subject such as the environment, healthcare, disasters, language, literature, etc. Blogs have been traditionally used by individually as a method of self expression and communication with others via host websites, however, the potential of such technology as a method of communication has led to businesses (Fitcher, 2005).

Blogging is also becoming a fast cornerstone tool in the online dissemination and consumptions of information (Dhiman and Sharma, 2008). Librarians are becoming the early adopters of blogging to support informing their clients and themselves of new web and
information technology resources, of changes to library services and collection development, and for various internal purposes such as distributing information and mounting team-based projects. There are numerous advocates for the use of blogs in libraries. Ojala (2005), for example, urges us to: “Think of a library blog as a marketing tool and a way of informing your users of your collections and capabilities.” Prasad (2004) agrees that blogs have great potential for marketing libraries but recognizes the need to characterize your target audience and so that key messages can be relayed to that audience. Whilst blog may not be a suitable medium for providing detailed answers to specialist enquiries such as those regarding genealogy (Reid, 2003), but they can have a number of uses in a special collections/local studies context. They can be used to answer basic or frequently asked questions, thus providing a searchable FAQs page that is being regularly updated. They can also be used to highlight upcoming events and promote resources. They have the potential to draw in a new set of users who may discover the library through blogging rather than through more conventional methods, and at the same time demystify and personalize librarians who have so often been seen as barriers to access in the past (Traister, 2003).

(iv) Digitized Materials: Digitizing the library collection, especially the special collections holdings can have a number of advantages and disadvantages. The mounting of materials and exhibitions in cyberspace can increase the potential for contact with collections from a comparatively small number of local people and those willing to travel to see them, to millions of people worldwide (Balas, 2002; Bengston, 2001). Widened access to collections also produces heightened visibility of the library and its stock as a by-product, which can have very positive effects on public relations (Normore, 2003; Liew, 2005), as well as on user numbers both in terms of website hits and physical visits to the library.

(v) Exhibition: Exhibition may be an excellent medium of promotion, especially for those libraries who also serve external users.

(vi) Presentation by Special Guest Speaker: Presentation may be given to a selected group of users by special guest speakers.

(vii) Library Orientation Programs: Orientation programs may be arranged for new comers.

(viii) Special Training Programs: Special training programs may be organized for employees.

(ix) Seminars: Organize seminars to educate users for library services.

(x) Newspapers, Radio and Television: Libraries can advertise their services through newspapers, radio and television also but this channel of promotion will cost money.

(xi) Silver Speech: Speech is the most effective and cheapest means of promotion which can be adopted by any library.

7. Library and Information Products and Services (LIPS): Marketing Aspect

All above mentioned marketing concepts can be applied to the marketing of library and information services & products but when we have to define what kind of marketing it is we have to study the basic concept behind the library and information services. The basic nature of library services is related to some kind of advice or search. There are more services than product involved in serving a library clientele.

In other words, marketing of LIPS means informing the user what libraries can provide, how these can be obtained, what is the fee or terms and conditions for obtaining LIPS, assessment of user needs of LIPS i.e. feedback from the users, improvement of LIPS within certain limitations and public relations with the users of LIPS.
Marketable products are as follows:

(i) Library print resources (books, journals), e-resources (e-books, e-journals, e-database: current and back volume)/online resources (online journals, current and back volume online database) through institutional membership

(ii) Online network base services e.g. INFLIBNET, DELNET

(iii) Audio Video Cassettes

(iv) CD-ROM/DVD-ROM database

(v) Current Content

(vi) Bibliographic Services

(vii) Current Awareness Products

(viii) Indexing and Abstracting Products (Indexed Bibliographies, Abstracting Bulletins, Customer Searches)

(ix) Digest extracts, Descriptive review/trend, reports compilation

(x) Translation, editing, publishing

(xi) Inter library lending services

(xii) Exchange of publications

(xiii) Forthcoming conference/seminar services

(xiv) Selective Dissemination of Information service to faculty members

(xv) Users' education

(xvi) Organization of book exhibition, technical demonstrations

(xvii) Audio/video programmes of technical lecture and displaying facilities

(xviii) Library automation products

(xix) Reference services

(xx) Training and consultancy

Non-marketable products are:

(i) Photocopying services

(ii) Copying of CD-ROM databases

(iii) Reproduction of Ph.D./M.Phil. theses

Rama Rao & Jain (1999) state that librarians should be aware about major legal and political factors that affect the library and information marketing:

(i) The patent and copyright laws meant to safeguard intellectual property rights

(ii) Import restrictions on electronic data transfer

(iii) Import duties on equipments and software

(iv) Government policies in relation to ownership and funding to educational and research institutions.

9. Professional Skills for Marketing of Library Services

Excellent marketing skills and techniques are essential for a library and information centre's success.
9.1. **Necessary Skills**

For marketing, development and implementation following skills are needed:

(i) Information literacy skills
(ii) Digital literacy skills
(iii) Media literacy skills
(iv) Critical thinking and problem solving skills
(v) Self-directional skills

9.2. **Changing Attitude**

Librarians need to bring drastic change in their attitude because generally users embrace negative feelings towards librarian. They should adopt some marketing techniques to maintain a good relationship with users. They should always be polite, and provide quality information service.

9.3. **Friendly Environment**

Librarians have to expand a friendly environment in libraries otherwise users will be vanished. They should encourage them to move toward in library. It will be possible only with cordial and friendly relation with users.

9.4. **Relationship with Users**

Librarians/Library professionals must pay attention to the user's requirements and desires. Professionals should know how to communicate well with users and be able to create a welcoming IT environment and build confidence in the users. Professionals should have perception of user's needs and should be able to obtain feedback from users.

Professionals should alert about the following matters:

- Give service with full attention and sincerity.
- Give him/her service to the best capacity at your command.
- Give him/her service in all modesty and in full freedom from any touch of prestige or ego.
- Give him/her service in full measure there should not be any offence to the laws of library science.
- Acquire the best knowledge and information for giving him/her best services.

10. **Barriers in the Marketing of Library and Information Products and Services**

Most librarians do not market their library products, since they do not know how to market, or do not know how to do it well. The following are the barriers or bottlenecks in promoting library and information products and services.

10.1. **Money and Attitude**

Lack of funds is often used as a reason not to market. However, marketing library services is not simply a matter of spending money on promotion and advertising. Marketing is also a matter of improving the customers' experience of library services. Since the library staff interacts with customers, their attitudes have to be changed in such a way to understand
what shapes customers' experiences and how to market library services to those customers. Majority of library staff do not have positive attitude.

10.2. Lack of Training and Education

Often librarians do not promote library services well due to lack of training and knowledge of marketing tools and techniques. Despite the growing literature on library marketing, there remains a lack of familiarity with the total marketing concept among librarians.

10.3. Passive vs. Active Stance

Rather than selling the library on its value and let the people to know what the library or information centre offers, librarians often wait for customers to come to them. Rather than pushing out responses to anticipated information needs to customers, librarians wait for customers to stop by the facility or stumble across the library website.

10.4. Myth

People believe that libraries do not need to be promoted because in general, the importance of libraries is not clear to them.

10.5. Attitude and Communication

Library professionals need to learn different styles to communicate with diverse users and create a positive attitude as most users have negative image towards the librarians.

10.6. Complete Task

Marketing of library services is a complicated task for librarian because of its wide range.

10.7. Fear

Librarians fear of commercial publicity and see marketing as manipulative, wastage of time and resources, and unprofessional for their profiles.

10.8. Old Models

Sticking to old models bar the introduction of new ideas and implementation of new services some of such models are:

- Many librarians work on the old model of existence by order.
- Faculty should send their students to librarians for support
- Students should use library databases to locate quality information for their papers.

11. Conclusions

The digitization of special or rare collections can be costly, both in terms of financial outlay and the time/effort needed to bring such a project to fruition, but it can be an important way for marketing in libraries.

Libraries have enormous potential to earn revenue by marketing of library services. The main aim of marketing is to make the users know and understand that the libraries able to satisfy their need and beyond. The library can be called an information market and the library user is a consumer of information. Marketing of library services is an essential step in the planning, designing, and use of services for optimal use of information. Library acquisition and organization must be based on the modern concept of marketing to its user's
satisfaction. Marketing of library services is the effective execution of all the activities involved in increasing satisfaction of users by providing maximum value to them. It is a total solution for library and information centres. Sooner or later, all librarians and information science professionals have to realize the importance of marketing concepts because library is no longer just a warehouse of information. It is fast changing the powerhouse of information where speed and accuracy is all what matters. So, Librarian must develop a marketing plan and should include these services, i.e. user education programmes, packing of information, hyper linking relevant sites, meetings and seminar.

Lastly, the Librarian need to develop an in-depth knowledge of models, theories and processes to market reference and information services effectively. Additionally, the librarians must acquaint with the necessary qualifications to present them before the user community as information managers. They are supposed to be expert in the marketing concepts in order to place themselves as information marketers rather than information providers.

ABSTRACT : E-commerce development is the implication of swift and enormous growth of Information Communication Technology. Electronic communications have become an integral component of the global economy. There is a gradual increase in the digital information component in the holdings with a growing dependency on digital computer and ICT with high speed electronic resources, particularly in science, engineering and technology and also academic libraries. International regulations must allow the spreading of e-commerce and the associated encryption products, in order to establish a secure e-commerce environment that customers can trust and allowing an international deployment of e-commerce solutions without restrictions. According to digital rights management (DRM) is a term that is used to describe a range of techniques which collect information for rights and right holders, so as to manage copyrighted material; and the conditions under which these materials will be distributed to the users. DRM refers to the protection of the intellectual properties of digital content by controlling or detecting the actions of the authorized end user to the digital content. It gives the digital object's owner the ability to securely distribute valuable content such as books, photos, videos, magazines; at the same time helps the owner manage the content, avoiding unauthorized usage or copying. The copyright protection is mainly achieved extensive use of digital watermarking. Digital library development should be taken up as an additional task to populate the web sites with valuable in-house content like the research reports, publications of in-house researchers, and so on. Digital library projects and developments in the country are so many, though a large number of them are only at an aggressively enthusiastic preliminary stage. Using cryptography, communications and information stored and transmitted by computers can be effectively protected against interception. Modern encryption technology mathematical processes involving the use of formulas (or algorithms) were traditionally deployed most widely to protect the confidentiality of military and diplomatic communications, and until recently encryption facilities were only demanded by government agencies. With the advent of the computer revolution and recent innovations in the science of encryption, a new market for cryptographic products has emerged.

1. Introduction

Electronic devices for accessing information are becoming increasingly mobile. There are, however, a number of scenarios in which the owner of some information might want to restrict access to that information to a particular geographical area. For example, companies want to prevent sensitive trade secrets and intellectual property from leaving the
boundaries of their offices, and publishing houses want to maximise the value of their publications in different geographic markets. Over the past decade, digital rights management (DRM) has become an important technology in the protection of copyrighted multimedia works, sensitive corporate information and private data. DRM allows information owners to control the use and dissemination of electronic files via a machine-readable licence that sets out the terms and conditions under which a file can be used. A licence for a file sets out that may access the file, what they may do with it, and under what conditions they may do it. In this paper, we are principally concerned with licences that restrict the use of files to a particular geographical area, such as the physical premises of an organisation or a particular legal jurisdiction. Enforcing location-based access control policies requires the access control enforcement point to be aware of the movement of a mobile device during the exercise of a controlled action. In the past decade, we witnessed an explosion in the distribution of digital media such as compact discs (CD-ROMs), digital video discs (DVDs), and digital television. Digital and peer-to-peer (P2P) technologies, for example Napster and Gnutella, have also made duplicating and distributing illegal copies of copyright-protected material fast, easy, and cheap. Copyright protection and piracy have become the major problems in the music business. In order to combat the potentially disastrous losses to revenues in the music business, the major owners and distributors of copyrighted media contents, such as image libraries, the music and film industries, and online publishers, have sought ways to detect and prevent copyright infringement. Rights management has therefore become a very important concern to content providers to enable rights verification, ownership identification, copyright protection, and control of access rights. Rights management, in general, refers to the problems associated with intellectual property rights, including copyright protection and, in particular, to the problem of assuring that, in a commercial setting, payment is made for a particular use of content and that the actual use does not exceed the authorized use.

2. Electronic Commerce (E-commerce)

The emergence of e-commerce is creating fundamental changes to the way that business is conducted. These changes are altering the way in which every enterprise acquires wealth and creates shareholder value. The myriad of powerful computing and communications technology enabling e-commerce allow organizations to streamline their business processes, enhance customer service and offer digital products and services. This shift in underlying marketing fundamentals is now the driving force that is luring many organizations to embrace e-commerce.

2.1 Four Entities of e-commerce markets

The process of trust formation in e-commerce, it is necessary to understand first the e-commerce market structure and its entities. Based on Shaw's structure, we can view the Internet exchange process as an interaction of four different entities: the buyer, the seller, the third party, and technology. In figure 1 the four different entities represent three ingredients in the trust formation process in e-commerce: trustor (buyer), trustee (seller) and environment (technology and third party). In e-commerce, buyers are individual consumers and sellers could be online retailers, intermediaries or suppliers. Third parties are impartial organizations including individual mechanisms delivering business confidence through an electronic transaction, using commercial and technical security features. Online transactions for electronic commerce include services provided by many trusted third parties such as banks, credit card authorization organizations, consumer online privacy institutions, and consumer confidence program groups. An example of the third party involved in the trust of online transactions is TRUSTe, a nonprofit, privacy seal program.
2.2 Process-oriented, six dimensional model of trust formation in online exchange

Based on the market structure and the interactions of four entities, we argue that trust formation can be described in terms of six dimensions: consumer behavioral, institutional, information, product, transaction, and technology as depicted in figure 2. One of the critical portions of electronic transactions is the technology dimension. The Technology dimension captures and portrays the IT infrastructure of e-commerce in a layered architecture, namely (i) the e-commerce technology infrastructure (implemented in both hardware and software), (ii) the e-commerce services, and (iii) the e-commerce business applications.

3. Digital Rights Management (DRM)

Radical changes in information technology coupled with the evolution of the Internet in the early 1990s drastically disturbed the hitherto maintained balance between the interests of content producers and consumers. Content consumers were empowered with a technology to make perfect copies of digital content and distribute it around the world with virtually no effort or cost. To stem indiscriminate copyright violation of intellectual property, technologists were pressured by content producers to develop effective copy protection systems. This gave rise to a slew of digital rights management (DRM) systems in the mid-1990s such as the IBM cryptolope, and the ambitious DigiBox technology by InterTrust, just to name a few. The fundamental security requirement for a DRM system is that the hardware and/or software used to access protected data be guaranteed by its manufacturer to behave in accordance with licences. A terminal is an abstract single-user player, editor, or similar that may be implemented as a hardware device, a software application or combination of the two. Figure 3 shows our reference model for a DRM system. Information is created by a provider, and transmitted in a protected (for example, encrypted) form to a user via some distribution channel. In order to access the protected data, the user must obtain a licence from the licence issuer. Licences are written in a machine-readable rights expression language that sets out the terms of use of the data and the information required to access the protected content. Figure 4 shows the reference model for a terminal. When a user wishes to perform some particular action on a particular item of data, the decision point checks that the user possesses a licence that permits that action. It further checks that the licence has been signed by a recognised licence issuer, and that any conditions associated with the permission are satisfied. If a suitable licence does not exist, or the conditions are not satisfied, the decision point will refuse to carry out the operation. Otherwise, the enforcement point will be
permitted to retrieve the data key, and the renderer enabled to carry out the desired operation.

3.1 DRM requirements

Most digital content available today is managed by at best rudimentary DRM systems, if DRM is deployed at all. The issue of what services should be provided by a DRM system was considered by the MPEG-21 Committee. Their requirements emphasize the need for interoperable DRM systems that will work universally. DRM systems should support seamless flow of content in order to support the implementation of end-to-end content supply chains. DRM systems also need to support different business models and are supposed to work across different types of devices supporting different license and transport formats. It is difficult to build a DRM system that can simultaneously satisfy all of these requirements. Even if such a system were built, it would soon have to be changed to meet evolving needs and technology advances. For example, the rendering platforms over which DRM systems are built will change, and new external devices will be developed that support evolving media formats. Furthermore, the DRM requirements themselves are not static; they are likely to evolve with the passage of time in conjunction with changes in technology. For example, increasing broadband penetration will likely lead to the development of new services. These are precisely the types of problems that layered systems have proved useful in mitigating. Layered systems with well-defined interfaces thus make sure that rapid changes in technology at one layer do not affect the functioning of the other layers, as long as the interface standards are maintained. This ability has been remarkably demonstrated by the layered network architecture of the Internet. Thus, it appears that a layered DRM framework, which identifies and divides the different aspects of DRM, makes sense.

3.2 The DRM layers

Consider the client-server model associated with a typical DRM system, where a user on a client machine wishes to purchase a piece of content, and the server side is responsible for delivering the content, along with its associated rights. There are three basic DRM processes that must be supported within this framework. At the highest level, the client and the server must agree on the terms of content usage, and this should depend on the degree of trust the server has for the rendering platform. An intermediate level is concerned with how the rights are specified, as well as how they should be interpreted in particular environments. At the lowest level, the concern is how the rights will be enforced on the client side. Thus, once an
application on the client side is able to understand the rights associated with a piece of content, it has the responsibility of enforcing those rights. From the server's perspective, it should not matter how this is accomplished. That is, the server side only needs assurances that the client is able to enforce the rights and that the client will indeed enforce them, not the manner in which this task is accomplished. In other words, to achieve desired levels of interoperability, independence of DRM services and rights enforcement mechanisms is necessary. The key to allowing this desirable architectural property is the rights expression and interpretation process, which we believe is the minimal requirement for any DRM system. Similar to how the Internet Protocol (IP) provides a least common denominator to achieve independence of networking technologies and networking services, RELs play a central role in determining the degree of independence between DRM services and rights enforcement mechanisms.

### 3.3 Service layers

The DRM service layers are essentially layers that enable different business models and trust establishment mechanisms. These services include deciding upon the type (i.e., resolution, format, etc.) of data that will be delivered, payment transactions, rights negotiations, identification and authentication, encryption protocols, trust establishment with the user, and the content rendering environment. The service layers are divided into at least two parts as shown in figure 5, an application layer that supports custom-made services for applications depending on the requirements of the domain, and a negotiations layer that implements generic DRM services required by most DRM applications. The central responsibilities of the application layer and the negotiations layer are the implementation of business logic and trust establishment mechanisms as shown in figure 6.

![Diagram of DRM layers](image)

**Fig. 5:** The interactions between the client and server sides in a layered DRM framework. (Dashed arrows correspond to inter-system communications, while solid arrows correspond to intra-system communications.)

**Fig. 6:** An overview of each layer (left), along with its responsibilities (middle), and an example from current systems (right).

### 4. DRM services

The complex nature of RELs made it impossible to factor out common DRM services, which can potentially be reused by different DRM systems. Many of the DRM functions such as trust management, rights translation mechanisms, usage tracking, etc., are complex, distributed in nature, and common essential requirements for DRM systems to interoperate in an open environment. Refactoring of RELs enable 'liberation' of these functions from their dependencies on RELs. Once these services are developed in an independent manner, it is possible to improvise by enabling their reuse by different DRM systems. Middleware services particularly aim to address this issue.
4.1 Middleware and Negotiations layer services

The problems mentioned above are exactly the problems commonly addressed by middleware solutions. Therefore, DRM middleware must create an expandable, consistent, and distributed service representing these functions. Applications can then use this middleware to develop their own DRM services. Negotiations layer deals with establishment of terms of agreement and trust management. Two major middleware services operating at this layer will be trust management services and payment services. Trust management services ensure user and system-level trust between licensing server and the content rendering environment. As an example, Microsoft DRM 10 implements trust management by device certification of content rendering platforms. DRM systems require much more complex payment service than traditional business models. Many DRM applications require super distribution of content in which the buyers sell the content on behalf of sellers and get a share of the price paid. DRM applications will require payment services to manage such complex transactions. Finally, rights negotiations can be thought as a middleware service, where DRM vendors provide ‘rules of negotiation’ to the service which negotiates rights with content rendering environments on behalf of the vendors. These three services defined in the negotiations layer must collaborate to provide sophisticated negotiation services to DRM applications. The interaction of these services is shown in figure 7. Such a service will allow application developers to support a range of complex negotiation scenarios.

4.2 Rights expression and interpretation layer services

A middleware service offering compatibility with rights expression and interpretation will allow DRM service providers to express rights without worrying about their compatibility with enforcement platforms. ODRL and XrML are the two most common RELs currently used. The expressive power of RELs is not the same. The process to convert a license in one format to another is very complex. Before the license is converted, the rights need to be cast in terms of the new environment. The factors that need to be taken into consideration during license conversion is an area of active research.

**Fig. 7:** The use of a complex negotiation service as middleware used by the DRM license server.

4.3 Usage Tracking Services

In addition to rights enforcement, content usage tracking forms one of the crucial components of many DRM applications. The digital rights enforcement (DRE) upper layer implements license management mechanisms. It is the license management mechanism that
keeps track of content usage by the user. Different devices have different license management mechanisms which keep a track of content usage in different formats. Also, these devices have different levels of network connections, for example, some devices may connect to the network only intermittently. A DRM vendor application which wants to keep track of the usage of particular content must have the ability to query these different license management mechanisms. A middleware for tracking usage will provide a consistent interface to query content usage. Various policies for gathering information from different devices with different properties can be implemented in the usage tracking middleware. The workings of such a tracking service are shown in figure 8.

**Fig. 8:** A middleware service providing content usage tracking service.

4.4 Indirect DRM evaluation architecture (IDEA)

The indirect DRM evaluation architecture (IDEA) is a prototype implementation that addresses the major hurdles in DRM systems, which are interoperability and REL simplification. IDEA makes clever use of available infrastructures namely, the Handle System and the transient network architecture (TNA) to achieve this goal. IDEA uses the Handle System for indirection via persistent identification and the TNA for abstraction of RELs. Such an approach enables separation of DRM services from rights enforcement mechanisms. The Handle System provides a generic environment for persistent identification of entities along with the specification of their attributes. The Handle System also provides security options for data integrity and confidentiality along with a distributed administration service. The TNA introduces the Ghost and Shell model in which the Shell separates the low-level hardware specific operations by an interface consisting of a common neutral environment language of operation instructions to roaming agents called Ghosts.

5. Rights Expression Languages (REL’s)

Over the past several years, a number of RELs have been developed, with the extensible rights markup language (XrML) and the open digital rights language (ODRL) becoming the most popular. Recently, XrML was adopted as the standard REL for inclusion in the MPEG-21 standard, and ODRL was accepted by the OMA as the standard REL for mobile content. Nevertheless, these RELs have not been extensively used in applications, despite the fact that many businesses suffer from problems that could be solved using appropriate DRM technologies. For instance Apple and Microsoft have created their own lightweight DRM technologies, iTunes and Windows Media DRM 10, respectively that do not make use of any commercially available REL. At the very least, from an interoperability perspective, there would be some advantage to users if a simple standardized REL were used by both of these systems. Both XrML and ODRL are much more than RELs, as they handle many additional
aspects of rights management. For this reason, it may be more appropriate to refer to them as DRM languages. Furthermore, the comprehensive nature of these languages makes them difficult to analyze and hard to use in practice. The shortcomings of such an approach with respect to interoperability and design of modular DRM systems are studied later in this section. This is followed by contrasting the advantages and disadvantages of a use-case based approach and an architectural approach in designing RELs. Digital rights management systems provide features usually aimed to safeguard the interests of copyright holders. These features include: copy control, access control, usage metering and traceability. Digital right management systems are less mature compared to pure transactional security systems or protocols (i.e.: SSL, SET) and may provide different features and functionality from different vendors shown in figure 9 and figure 10.

SSL is a protocol created by Netscape that runs above TCP/IP and below other higher-level application protocols, such as Hypertext Transport Protocol (HTTP), Lightweight Directory Access Protocol (LDAP), Internet Messaging Access Protocol (IMAP), etc. SSL allows authenticating both the client and the server, and also establishing a secure connection between client and server. SET is an open-network payment-card protocol. It is primarily designed to ensure the security of electronic transactions over the Internet. The process involves a series of security checks performed using digital certificates, which are issued to participating purchasers, merchants, financial institutions, and payment brands.

6. Results and Discussion

The results of this study show that the two perspectives (academic and practitioner) are divergent in several ways and complementary in others. It is our belief that the two perspectives need to be combined to represent meaningful trust-building mechanisms in websites. The perspective of academics is more pronounced in the foundational elements of trust-building mechanisms such as the consumer behavioral and web information contents dimensions. On the other hand, corporate practitioners tend to emphasize more the practical, surface elements emphatically shown in technological and product dimensions. In this research we find that the trust-building model proposed in this research in fact captures the basic building blocks of Internet trust and allows us to consider both the perspectives of academics and corporate practitioners simultaneously.

Partitioning DRM systems in this manner provides an alternate and more manageable view to the study interoperability in terms of standards and protocols required to define interfaces and system-level trust mechanisms. It is thus possible to create spaces where innovation can be allowed by identifying them as ‘no standards zones’ and areas where standardization is essential in order to achieve interoperability. We showed that the
boundaries of current RELs 'spill over' to the other layers and create unnecessary dependencies limiting the degree of achievable interoperability. It is necessary to refactor current RELs with a simple core for rights expression with well-defined boundaries, based on the principles stated in the paper. Refactoring of current RELs is essential for 'liberation' of rights management mechanisms and DRM services which is a necessary condition for interoperability in DRM systems. Finally the IDEA framework shows how existing systems such as the Handle System and the TNA can be exploited for indirection and hardware abstraction to support DRM interoperability and use cases such as super distribution and authorized domains.

The Changing Role of Public Library Extension Service 
With Special Reference to Distance Education / Open Learning / Mobile Learning : Indian Scenario

Mitali Das Gupta
Shri Shikshayatan College, B.Ed.Dept, Kolkata-700071
Email : mitalimitan@gmail.com

Abstract: Public Libraries are social institutions offering services based upon books and information for various public groups on social, political, economic, cultural and other matters. They play a very significant role in the welfare of the society. Among the many other services public library plays a vital role in organizing and providing extension services for the members as well as non-members. The objective of extension service is to convert a library into a social, cultural and intellectual centre, which encourages reading. Thus an extension service aims at converting non-readers to readers. It creates and stimulates the desire for good reading. This is done by bringing books and readers together. The term "library" is normally associated with the concept "education". Education / Learning nowadays are becoming a lifelong process. Teaching and learning are no longer confined to the classroom or the school day. Distance education (DE) has been in existence for more than a century. Until recently, many people regarded DE as unconventional and a peripheral function, and the sheer distance between teachers and students, rendered teaching and learning not only inefficient but also ineffective. The improvements in communications and information networks have demolished the barriers of physical distance and other inherent shortcomings affiliated with DE. DE / OL / ML has made remarkable progress over the last two decades and has now gained widespread acceptance. Further, the use of information technology (IT) is giving this system an edge over the conventional system. Information technology can be used both for instruction and document delivery and libraries play a vital role in this context. The rapid expansion of IT, computer literacy and access to the INTERNET offers immense opportunities for online delivery of DE and training. In distance education, learners are far away from their teachers and instructions are imparted through multi-media approaches. Hence, the role of libraries becomes a basic requirement to fulfill this gap. It is important to note, that the vast majority of our population does not have an access to institutional libraries, and for them the only source for accessing information and knowledge resources is Public Libraries. The recommendations of NKC (National Knowledge Commission) in 2005 have provided a roadmap for the development of India's public library system. Hope in future public library system of India will be successful to achieve the goal as a co-operative support system in the field of country's Education.

Introduction
According to Ranganathan “Apart from different methods of publicity, libraries are now-a-days developing certain new types of work, which in addition to their being directly educative or recreational, lead also publicity as an important secondary product”. This has been termed as “extension service.” The objective of extension service is to encourage reading. The broader objective of a library is to create and stimulate good reading habits. The library achieves its objective by bringing books and readers in close contact. The aim of modern libraries today is to provide services not only to its registered members but also to every member of the society, so that the libraries may become familiar in local public. To make libraries familiar, extension services should be arranged so that the people may get maximum benefit from them.
Library and information service for DE is often an extension of the institution's existing traditional library service. Among the different types of libraries evolved by society in modern times, Public Libraries are the most important ones because of the geographical area they cover; the vast and varied user population they serve; lifelong education they permit; and the function they perform. They play a very significant role in the welfare of the society in fulfilling many of its fundamental needs like communication of information, education, recreation, and socio-cultural development.

Distance Education /DE

The term “library” is normally associated with the concept “education.” Education / Learning nowadays are becoming a lifelong process. Teaching and learning are no longer confined to the classroom or the school day. In The word of Dohmen (1967), “Distance education is a systematically organized form of self-study in which student counseling, the presentation of learning material and the securing and the supervising of students success is carried out by a team of teachers, each of whom has responsibilities. It made possible at a distance by means of media which can cover long distance.”

1. It is flexible with regard to qualifications and age for entry.
2. It may or may not be for a degree or diploma.
3. It is a system of mass education.
4. It is available even in the areas where there is no school or colleges.
5. It is available even in those with poor health or disadvantageous psychological conditions that inhibit them from undergoing institutionalized education.

Main Objectives of Open Education

- Providing a suitable alternative path to wider opportunities in education and especially higher education.
- Providing opportunities to students who had to discontinue their formal education on account of various circumstances pecuniary etc.
- To cater to the educational needs to people residing in geographically remote areas.
- To provide opportunities to the students who cannot find a seat or do not wish to join a regular course or university departments although they possess the necessary qualifications to pursue higher education.
- To provide opportunities for citizens who are willing to improve their standard of knowledge and learning through continuing education while in business.
- To provide opportunities to persons engaged in different professions to get higher degrees or certificates which may enable them to get higher jobs or promotions better emoluments.
- To cater to the needs of citizens who look upon education as a lifelong pursuit and may like to refresh their knowledge and skill or to acquire knowledge and skill in new areas.
- To provide courses according to specific needs of individuals.
- To provide opportunities for in-service and pre-service training to teachers.
- To enable students to learn while they earn and vice versa.
Some Synonymous Terms of Distance Education

- Correspondence education / learning
- External degree programme
- Home study / tuition
- Independent learning / study
- Non-Formal education
- Life Long education
- Off-campus study
- Open learning
- Tele university

In 1962, the University of Delhi initiated DE in the form of correspondence courses; In 1982, the first Open University was established in Andhra Pradesh as Andhra Pradesh Open University, subsequently renamed as Dr B R Ambedkar Open University (BRAOU) in 1985, the Indira Gandhi National Open University (IGNOU) and in 1987, the Kota Open University - renamed as Vardhman Mahaveer Open University (VMOU), Rajasthan, came into existence. Since then, the DE system has grown substantially and by the year 2002 there were 10 Open Universities and 64 correspondence courses directorates or institutes attached to different Universities providing courses through distance mode. Initially, these Universities reached their students through post offices and begun to supplement their courses in recent years with classes that use radio and TV broadcasts. They primarily cater to educationally disadvantaged groups such as unemployed, people living in rural areas, working people who cannot attend regular institutions, housewives, and the like.

In India there are four types of institutions offering distance education, namely: IGNOU, State Open Universities, Directorates of DE functioning under conventional Universities (Dual Mode Universities) and private professional institutes.

Distance education (DE) has revolutionized and democratized the delivery and accessibility of education. In DE, learning takes place at the location of the student and not at the institution of instruction. Traditionally, distance learners were rural-based, middle aged and female. Today's distance learner is located anywhere, of any age and gender.

Technology Used for DE

Satellite Technology, Audio-visual Medium, Integrated Communication Networks (ICN)

Networks

ERNET India (www.eis.ernet.in/), EDUSAT (www.isro.org/edusat/), Europe*Star (www.europestar.com), Skymantra. Skymantra is a broadband network from Bharti Data and Broadband Group that can be used for connectivity in DE.

Role of libraries in DE

When establishing DL(Distance Librarianship) procedure, traditional library standards and procedure can be applied as a guide. DL is used to provide most traditional library services such as consultation, reference and bibliographic searches, and course reading material.

In Distance Education, learners are far away from their teachers and instructions are imparted through multi-media approaches. Hence, the role of libraries becomes a basic
requirement to fulfill this gap. In general, distance learners need some library and information services such as: loan of a particular text or specific reference book; photocopy of a specific journal article or single chapter of a book or previous examination papers for their course; information/material on a particular subject; self-instructional materials; viewing and listening to audio-visual materials; using different type of library collection, equipment and facilities available in the library. Library facilities to distance learners vary from country to country, based on policies and availability of communication technologies. Such as telephone, telex, facsimile, e-mail, internet, etc. Generally, providing post-secondary level DL service is the most challenging, as the information and consultation needs of students and faculty cannot be satisfied just with pre-packaged reading and information.

**Issues in Providing Distance Library Services**

- Timeliness of service
- Maintaining a high level and quality of access to DL materials
- Where possible, personal contact with students and faculty.

**Access to materials and document delivery**

In addition to distance and time-difference barriers, national censorship and religious beliefs in receiving countries affect document and information delivery. In some countries, all e-mail and Internet sites are monitored before individuals can access or download them, or access may be blocked altogether. Electronic information sources (e-mail, e-books, databases, virtual libraries, Web pages) are heavily used in developed countries, but are not readily available or in widespread use in many developing countries.

DL services must be sensitive to these realities and establish non-electronic ways to field enquiries and to deliver services. For example, mail, fax or phone can be used for enquiries. Print copies or audio and videotapes of materials can be sent through regular mail or by courier.

**Consultation services**

Consultation can be conducted through e-mail, toll-free telephone services, pre-packaged mail-out information or scheduled remote site visits. Institutions that have a toll-free telephone service should if possible also use it for library consultation.

**Reference services**

In the DE environment, students can use forms to make research queries, either in print or electronically. In the form, "trigger" or "prompt" questions replace face-to-face assistance in helping the student to properly complete a request. Institutions that already have dedicated library telephone services can use them for DL reference inquiries. Some institutions with Web-based services purchase online versions of major reference works to provide students with a convenient access point, such as Athabasca University's Digital Reference Centre, [http://library.athabascau.ca/drc](http://library.athabascau.ca/drc).

**Bibliographic searches**

In some cases, and where enough staff is available, librarians execute full searches for distance learners. Another way is to provide a student manual on conducting bibliographic searches which explains search methods, such as moving from general to specific questions, and lists basic texts, journals and reference sources in various disciplines. More detailed "help" manuals can also be developed on a discipline-by-discipline basis.
Digital Library Service

Integrated Digital Libraries (DLs) create a shared environment by linking resources from a personal information collection to collections of conventional libraries and to a large worldwide database. The DLs allow teachers and learners to take advantage of a wide range of materials and to communicate with people beyond their immediate learning environment. The basic services provided by DLs include: online searching of databases, request of material through e-mail, electronic delivery of e-journals, Image files and ASCII files, online reference service, alerting services and SDI services via e-mail, provision of an electronic collection of e-journals and other reading materials, access to electronic indexes and directories, services like newsgroups, list serves and mail archives, internet browsing facility, etc.

Thus, the advantages derived from DLs in the context of DE are manifold. The basic advantages that one can derive from such systems: access to knowledge bases in a wide variety of media; accessible from the students' work places or homes, at their own convenient time, therefore cutting down the trip to different libraries; aid in avoiding the unnecessary duplication of material in different regional or study centers and making it a cost-effective means of providing library services; facilitate broader, faster and better delivery of resources, information and prevent loss of material in the transit.

Distance Library Services in Developing Countries

Historically, libraries in developing countries have been under-resourced, under-staffed and remote from the distance learner. Generally these libraries were unable to provide the range of services and materials needed, especially to support post-secondary education, and did not have hours of operation that were convenient for the distance learner. These factors remain significant challenges in the developing world, and for the institutions that provide DL services in such locations.

The following methods will help overcome some of these challenges:

- Rotating book boxes and other temporary "libraries" between pre-determined locations, such as community centers
- Collaborative and reciprocal borrowing arrangements between local and regional institutions and public libraries, such as partnerships with British Council Libraries
- Developing pre-packaged primary, secondary and tertiary library resources for circulation
- Establishing "distance library corners" in other libraries, e.g. "IGNOU library corners" throughout India
- Establishing sub-regional groupings of libraries to support distance learning
- Establishing information delivery partnerships with a broad range of institutions
- Using mobile libraries, including buses, book-boats and donkey libraries
- Using commercial delivery services, such as courier services.

Role of Public Libraries

Public libraries will be nodes connecting the local learning setting with the global resources of information and knowledge. Public libraries must therefore be allowed to play a role of fundamental importance in the development of future systems of distance learning. The development of the information and communication technology has already laid the
basis for the creation of information networks, giving users even of small local public libraries access to the world wide sources of information.

- The creation of electronic networks between public libraries and research libraries, school libraries and special libraries.
- The development of networks between public libraries and educational institutions and organizations.
- The use of information and communication technology in the libraries work with distance learning.
- Collection management; e.g. the balance between books, newspapers, electronic media and audio-visual media.

**Indian Scenario**

Majority populace of India is residing in rural and semi-urban areas. Rural communication and education has become a necessity for the upliftment of the society and eventually for the country. DE and learning is the only mode for increasing literacy at remote and tribal inhabitations. Dissemination of information and knowledge is required for geographically dispersed people. Basic education is required for women and child development in the villages and semi-urban areas.

India, as the world's largest democratic nation-state and an emerging economic power on the world stage, is a country beset with contradictions. Due in part to the information and communication technology (ICT) revolution, a middle class of over 300 million people now has the purchasing and consumption power. However, despite the wellpublicized ICT and information revolutions in India, rural and urban poor populations remain largely untouched by these advances.

Thus, while India is experiencing rapid economic growth, the benefits of this growth are unevenly distributed in the general population. Without addressing the needs of India's masses, the economic growth occurring cannot be sustainable in the long term. A major reason for India's continuing poverty is the government's poor record in providing basic services such as education to the masses - in fact, it can be argued that the inability to address these fundamental needs is the country's greatest post-independence failure.

One way to begin addressing these gaps and inequities is to reinvest in improved public infrastructure, such as education, information, and library services. With this goal in mind the Prime Minister of India, Manmohan Singh, has created the National Knowledge Commission (NKC), an advisory group to facilitate the development of a more equitable knowledge society. According to the Prime Minister, "The time has come to create a second wave of institution building, and of excellence in the fields of education, research and capacity building so that we are better prepared for the 21st century." Easy access to knowledge, creation and preservation of knowledge systems, dissemination of knowledge and better knowledge services are core concerns of the commission.

While Public Libraries in India have been recognized for their potential to be local centres of information and learning for the deprived masses, their current state of disuse and neglect is a major point of concern. In response to this issue one of the key recommendations from this working group is to encourage greater community participation in library management in order for libraries to become "community-based information centre".

Public libraries are particularly important in the Indian context, as they have the potential to make a dramatic difference in the empowerment of India's masses and in the development of a better educated and informed citizenry.
In addition, suggestions have been made to increase the effectiveness of public libraries by linking their services and goals to the larger National Literacy Mission (NLM) in India.

**Conclusion**

During the 20th century in India, Education has become recognized as an individual right; for the individual, education and learning is a road to personal development and a richer life. Furthermore, a higher general level of education is a necessary prerequisite for economic growth and employment.

In a society of lifelong learning - whether of a formal or informal nature- public libraries will be nodes connecting the local learning setting with the global resources of information and knowledge.

Public libraries must therefore be allowed to play a role of fundamental importance in the development of future systems of lifelong learning. The development of the information and communication technology has already laid the basis for the creation of information networks, giving users even of small local public libraries access to the world wide sources of information. The public libraries also offer guidance and training in information search and quality rating of information sources. Thus, public libraries are necessary if not sufficient prerequisites for a democratic knowledge society.

In this new situation public libraries and professional librarians will though have to change and adapt to new demands, professional tasks and working conditions. At the present though, we need more knowledge about how libraries and the professional profiles of librarians should be designed in order to improve their preconditions to meet the new needs and demands directed towards them.

Grants allocated are never sufficient to run public libraries in an efficient manner. There should be a separate grant for infrastructural developments and modernization of public libraries. Donation and endowments are also helpful in this respect.

Abstract: The paper presents the technological aspects of Wi-Fi technology and explores some of the major issues of wireless networks in libraries and components of the Wi-Fi technology. Fortunately, the technology has advanced considerably and can be deployed for keeping in view the user's needs; the libraries provide new technology-based services to them. To know the utilization of these new facilities/services among the library users, without sacrificing the security of library's network, Infrastructure facilities require for the libraries to go Wi-Fi network. Availability of commercial and free Wi-Fi services. Advantages and disadvantages of Wi-Fi services are also discussed.

Keywords: Wi-Fi technology, Access Point, ISP, ISDN, IEEE 802.11, WLAN, VPN, Protocol.

1. Introduction

Information and Communication Technology has created a sense of urgency and has created new possibilities for the development of new products and delivery of services. The area of services is experiencing tremendous changes at the user level as well as service provider level. Recent advances in networking technology have changed the way to communicate the information. Every day new technologies are emerging in networking field and libraries are adopting these technologies for the benefits of the users. Information technology has unfolded the technical capability to produce and disseminate information. Information and communication technology (ICT) has not only the potential to transmit information at greater speed and precision but also the capacity to deal large amount of diversified information. Over the past years, Wireless Fidelity (Wi-Fi) has popularised and become the dominant networking technology. Earlier networking was done through wiring but now various light and wave emitting technologies are in use. Wi-Fi is one of such emerging technologies, with the help of which, communication between computers can be done without cables. Wireless Internet access uses radio frequency signals to exchange information between a computer and the Internet. Wireless local area networks enable network users with laptops or devices equipped with wireless network interface cards to remain constantly interconnected while roaming within the range of a base station. Fixed access points can also be interconnected with wide area networks, such as the Internet or intra-corporate local area networks.

2. What is Wi-Fi?

The most common Wireless Technology is called WiFi, Which means 'Wireless Fidelity'. This is actually a combination of different protocols that use the IEEE 802.11 (Institute of Electrical and Electronics Engineers) specification standard. The Wi-Fi is an option on most computing devices.
The growth of Wi-Fi will be due to enterprise demand for mobile connectivity and the technology's ability to affect business process and dissemination of information. Wi-Fi is short for “wireless fidelity”, and is another name for a wireless communications standard called “IEEE 802.11b” or “802.11g”. 802.11b is the older slower version of this standard, sending and receiving data at 11 megabits per second; 802.11g is the newer, faster standard, capable of 54 megabit-per second communications. Laptops often feature built-in wireless network cards or accept plug-in adapters that support either 802.11b or g protocols. Both standards provide broadband connections to the Internet and allow users to surf the Web and use e-mail. Increasingly coffee houses, hotels, schools, airports, and (imagine this!) libraries are making Wi-Fi available to attract and meet customers' needs. A Wi-Fi hotspot network is composed of one or more access points, which are the “point” at which laptop or pocket PC user's connect to the wireless network.

3. Components of Wi-Fi Technology

The following diagram is an example of a hotspot network setup. The access point, firewall, and switch shown in the figure could be changed according to the requirements of the network. (For example, a 3Com® Wireless LAN Access Point 8750 could be used if simultaneous 802.11a, 11b, and 11g support is required.) For more information on 3Com products, see the product sections at http://www.3com.com/ or talk to your local 3Com reseller for recommendations.

3.1 Access point

An access point (AP) in Wi-Fi is essentially a compact radio transmitter with an antenna that connects to a wired connection, such as an Ethernet network, or digital subscriber line (DSL) or cable service supplied by an Internet Service Provider (ISP). The 3Com Wireless Access Point 7250 supports up to 253 wireless users at speeds up to 54 Mbps at distances up to 325 feet. Multiple access points can provide overlapping coverage throughout a site. APs can be installed almost anywhere because power and data are supplied over one cable and different antenna options offer various coverage configurations. AP in Wi-Fi can vary greatly in feature...
depending on their cost, some access points give an option of roaming where wireless clients can transparently switch from one AP to another.

### 3.2 Network switch

A network switch such as the 3Com SuperStack® 3 Switch 4400 PWR provides installation flexibility by distributing power and data over the same network cable through its built-in Power over Ethernet (PoE) capability. The 3Com switch supports up to 24 wireless access points. The switch also separates user traffic on the wireless network, for example, separating public user traffic from business operations traffic to keep business communications private and secure. The switch also prioritizes traffic usage for uninterrupted Internet access.

### 3.3 Secure router

The secure router detects and protects the wireless network and its users from Internet hacker attacks. The 3Com Office Connect® Secure Router also supports two private communications channels, or virtual private network (VPN) tunnels, for secure site-to-site or remote user-to-site data and e-mail exchange.

### 3.4 Wireless LAN bridge (optional)

A wireless LAN workgroup bridge expands a Wi-Fi hotspot's revenue potential by enabling laptop or pocket PC users without built-in wireless capability to connect to the hotspot network. Leisure spot businesses can rent a 3Com a/b/g Wireless LAN Workgroup Bridge and LAN cable to customers or guests who want the added convenience of Internet access during their stay.

### 3.5 Wireless authentication and billing gateway

Enables hospitality and leisure spot businesses to control access to the Wi-Fi hotspot network by conducting authentication checks similar to credit card or member ID authentication. The gateway also tracks wireless usage for billing purposes and provides payment transaction services. It interoperates with hotel, airport, or other leisure spot reservation systems to verify appropriate customer or guest use. 3Com has developed partnerships with leading authentication gateway vendors in order to offer plenty of choices and a local regional presence throughout the world. 3Com has thoroughly tested authentication gateway partner products with select 3Com wireless network products to ensure smooth network installation and integration.

### 4. Infrastructure Facilities to go Wi-Fi in Libraries

Wire free connectivity in network, is a simple as putting up a wireless access point, practically is not so simple. Many variables are to be considered for successful deployment. We need the following infrastructure to go Wi-Fi in Libraries.

#### 4.1 Broadband Internet connection

A broadband Internet connection through an Internet Service Provider (ISP) is available plus installation costs. Broadband Internet access typically is achieved using DSL, cable, ISDN (Integrated Services Digital Network), or dedicated frame relay access.

#### 4.2 An access point

An access point, preferably supporting both 802.11b and g protocols. Access points are dictionary-sized gizmos, incorporating the functions of a hub, a router, a transmitter, and a receiver. Your access point either connects to your LAN (local area network), or directly to the Internet. You can provide hotspots throughout your library with additional access points or
range extenders. Popular access point brands include Linksys http://www.linksys.com, and NetGear http://www.netgear.com. Access point (definition) acts similar to a hub (not a switch) on a wired LAN (definition), the total bandwidth is divided among all users using an access point (see the Bandwidth Availability section of Wireless Security). More importantly, the total bandwidth available is going to be limited by the speed of library internet connection (which is typically much slower, e.g., a T1 (definition) line is only capable of 1.544Mbits per second). An important consideration, especially if your Wi-Fi access is going to be sharing its internet connection with your wired LAN, may be the ability to limit bandwidth and/or protocols (e.g., http, https, ftp, etc.) either via the AP itself, or through another firewall or router.

4.3 Know How to connect to Library network

An understanding of what your patrons will need to know to connect to your network. Typically those bringing laptops into your library will know the ropes. But you might want to put together a brochure for the good of your staff as well as your public. Most of the library have all written great instructions to their patrons for awareness. Because patrons are used to an expectation of privacy in a library setting, it is especially important to inform your patrons of the necessity of properly safeguarding their computers and data when using relatively insecure public Wi-Fi.

4.4 An 'Acceptable Internet Use' Policy

Wireless users should abide by your library's acceptable Internet Use Policy. This is for your protection as much as their education. Some libraries offer filtered wireless access to the Internet, others don't. In terms of policy, wireless Internet access is probably no different than your wired Web workstation-related policies. There's an extensive compilation of good internet policies on Web junction.

4.5 Means of protecting your staff network from Wi-Fi users

Libraries have staff workstations, circulation systems, mail, and web or content servers. With any kind of public Internet access, wired or wireless, we can make constrain non-staff access to library applications and servers. There are two alternatives: a) Connect both staff and public access through one point of Internet access, and protect your staff-side with a bombproof firewall (usually a hardware firewall); or b) Connect staff resources to one Internet connection (don't forget the firewall), and connect public access (wired or wireless) to the Internet through another completely separate connection. This second option is probably the simplest to implement, and with broadband costs coming down, becoming more affordable.

5. Commercial Wi-Fi

Commercial Wi-Fi services are available in places such as Internet cafes, coffee houses and airports around the world (commonly called Wi-Fi-cafés), although coverage is patchy in comparison with cellular.

- (http://www.wisezone.net) provides commercial Wi-Fi for airports, universities, and independent cafes in the US;
- T-Mobile provides hotspots in many sectors in the U.S;
- Pacific Century Cyber Works provides hotspots in Pacific Coffee shops in Hong Kong;
- Other large hotspot providers in the U.S.include Boingo, Wayport and iPass;
- Sify, an Indian internet service provider, has set up 120 wireless access points in Bangalore, India in hotels, malls and government offices.

6. Free Wi-Fi

While commercial services attempt to move existing business models to Wi-Fi, many groups, communities, cities, and individuals have set up free Wi-Fi networks, often adopting a common peering agreement (http://www.freenetworks.org/peering.html) in order that networks can openly share with each other. Free wireless mesh networks are often considered the future of the internet. Many municipalities have joined with local community groups to help expand free Wi-Fi networks. Some community groups have built their Wi-Fi networks entirely based on volunteer efforts and donations. Many universities provide free Wi-Fi internet access to their students, visitors, and anyone on campus. However, there is also a third subcategory of networks set up by certain communities such as universities where the service is provided free to members and guests of the community such as students, yet used to make money by letting the service out to companies and individuals outside.

7. Application of Wi-Fi in Libraries

Wi-Fi offers tremendous speeds to user and up to 253 wireless users at speeds up to 54 Mbps stay in one place or at least within 100 meters of the same access point. Users can access library OPAC in any corner of the library, even in stacks while searching for books. Users can surf on Web-OPACs during search of documents. Users can surf internet in any corner of the library without bothering for occupying particular seats.

Libraries have introduced free Wi-Fi Internet access to the patrons those who bringing in their own wireless-equipped laptops can access to the entire range of full-text databases normally accessible from the library's own computers, as well as Internet access.

Libraries also will be using Wi-Fi-equipped laptops for PC training as part of the Library program of computer instruction. The Wi-Fi hotspot network is good news for all patrons, both with and without wireless-enabled devices.

Wi-Fi users can now employ their own laptops to tap into the card catalog and all of the library's research databases without having to wait in line for an available computer terminal, which in turn frees up more space for patrons without their own wireless devices.

Anticipated yearly maintenance costs have been kept down primarily because of the APs software, which allows the library's few IT staff members to manage the entire system from one central location, and to create and provision consistent security policies across the network.

Within the library, a certain part of the network is dedicated to police and other city employees. It extends out into the parking lot so that they can pull in and get wireless access without having to leave their vehicles.

8. Advantages of Wi-Fi

a) Unlike packet radio systems, Wi-Fi uses unlicensed radio spectrum and does not require regulatory approval for individual deployers.

b) Allow LANs to be deployed without cabling, potentially reducing the costs of network deployment and expansion. Spaces where cables cannot be run, such as outdoor areas and historical buildings, can host wireless LANs.

c) Wi-Fi products are widely available in the market. Different brands of access points and client network interfaces are interoperable at a basic level of service.
d) Competition amongst vendors has lowered prices considerably since their inception.

e) Many Wi-Fi networks support roaming, in which a mobile client station such as a laptop computer can move from one access point to another as the user moves around a building or area.

f) Many access points and network interfaces support various degrees of encryption to protect traffic from interception.

g) Wi-Fi is a global set of standards. Unlike cellular carriers, the same Wi-Fi client works in different countries around the world.

9. Disadvantages of Wi-Fi

a) Use of the 2.4 GHz Wi-Fi band does not require a license in most of the world provided that one stays below the 100mWatt limit and one accepts interference from other sources; including interference which causes your devices to no longer function.

b) Legislation is not consistent worldwide; most of Europe allows for an additional 2 channels; Japan has one more on top of that - and some countries, like Spain, prohibit use of the lower numbered channels.

c) The 802.11b and 802.11g flavors of Wi-Fi use the 2.4 GHz spectrum, which is crowded with other devices such as Bluetooth, microwave ovens, cordless phones or video sender devices, among many others. This may cause degradation in performance.

d) Power consumption is fairly high compared to other standards, making battery life and heat a concern.

e) To be easily breakable even when correctly configured. Although newer wireless products are slowly providing support for the Wi-Fi Protected Access (WPA) protocol, many older access points will have to be replaced to support it.

f) Wi-Fi networks have limited range. A typical Wi-Fi home router using 802.11b or 802.11g might have a range of 45 m (150 ft) indoors and 90 m (300 ft) outdoors.

g) Interference of a closed or encrypted access point with other open access points on the same or a neighboring channel can prevent access to the open access points by others in the area.

h) Free access points (or improperly configured access points) may be used by a hacker to anonymously initiate an attack that would be impossible to track beyond the owner of the access point.

10. Conclusion

Before going to major service initiative or materials purchase, libraries must carefully consider their reader needs, preferences and expected use of the service or material. Library professionals must know some of the technologies and there are always a million Do's and Don'ts for the situations they are approaching for networks and devices are no different. Wi-Fi may offer some better services in the libraries. It provides access to the remote users, where user community can access the databases like CD-Rom databases, bibliographic databases, and services like library web pages, off campus services through the library web pages. Though it offers good and tremendous services it may lacking with some other applications in libraries. Many advanced technologies have come like Wi Max, Skype etc. The New technologies may offer better services than with Wi-Fi services.

Abstract: Information and Information Management have emerged as a current ‘hot issue’ for many organizations. In this modern age of Information Technology, information is the most important factor in the long term success of both an individual and organization. In fact, information may be the only source of competitive advantage for an organization. Libraries as major organ of an organization need to know what the organization’s information assets are and how to manage and make use of these assets to get maximum return. The paper considers the partnership for Information management, and especially how librarians as Information professionals, users, and technology experts can contribute to effective Information management. This paper explores the phenomenon of Information Management (IM) from the viewpoint of a management academic with a professional background as a librarian. Then, the paper proposes new roles of librarians for maximizing the value of information in an intelligent organization. It is concluded that Information professionals will have to move from the background to the center of the organizational stage, to jointly hold the reins of Information management.

Keywords: Information, Information Management, Information Services, Information Technology, IT experts

Introduction

The empires of the future will be empires of the mind. With great power comes greater responsibility, said Winston Churchill while delivering a speech at Harvard University way back in 1943. The prediction of the great leader has come out true. The generation next will fondly remember the contribution of 21st century which is bringing a metamorphosis in the structural and functional dimensions of the society in a swift manner. Over the past century, our world, was characterized as the agricultural and thereafter the industrial age followed by the era marked by the entry of Information and Communication Technology.

In this modern age of Information Technology, information is the most important factor in the long term success of both an individual and organization. In fact, information may be the only source of competitive advantage for an organization. Libraries as major organ of an organization need to know what the organization’s information assets are and how to manage and make use of these assets to get maximum return. This paper explores the phenomenon of Information Management (IM) from the viewpoint of a management academic with a professional background as a librarian. Then, the paper proposes new roles of librarians for maximizing the value of information in an intelligent organization.
**Information and Information Management**

The organization’s success depends critically on a successful Information management. Information assets are the Information that an organization owns or needs to own to achieve its goals. Information equals knowledge, which is more valuable information form the human mind; includes reflection, synthesis, context formatted in some way.

Information is vital for managers, scientists, and for practitioners, in any organization to take decisions, to prepare plans, to control activities, to “outcast” competitors, to pursue research at advanced level, to provide services, etc. Information, formal or informal, is however, to be managed. Information is now seen as a valuable resource within many organizations. It is an organizational resource. It is a self-regenerative resource and it is the key economic element. It can be accessed by anyone from anywhere, any number of times, yet remain undiminished and unchanged: of course, this requires intensive use of information technologies. It is a resource that, if it is properly managed and used, can stimulate innovation, speed product development, raises levels of productivity, ensures consistent standards of quality and through all of these means raises the relative level of competitiveness.

The term “Information Management” is used ambiguously in the literatures of several fields: in computer science and its applications it is used as a synonym for information technology management or as identical to “data management”, where the emphasis is on the structures underlying quantitative data and their relationship to the design of databases. In business or management studies it has similar connotations to technology management, with an emphasis on the relationship of information technology to business performance and competitiveness. In the field of librarianship and information science it is identified with the “emerging market” for information workers (managers), whose perception of information embraces data, organizational intelligence, competitive intelligence, external information resources of all kinds and the associated technology (manual or machine) for handling these different sources. Compared with the other areas, information management in this latter context is more widely concerned with the meaning of information for the information user and with information retrieval issues.

Throughout the 1970s this was largely limited to files, file maintenance, and the life cycle management of paper-based files, other media and records. With the proliferation of information technology starting in the 1970s, the job of information management took on a new light, and also began to include the field of Data maintenance. No longer was information management a simple job that could be performed by almost anyone. An understanding of the technology involved, and the theory behind it became necessary. As information storage shifted to electronic means, this became more and more difficult. By the late 1990s when information was regularly disseminated across computer networks and by other electronic means, network managers, in a sense, became information managers. Those individuals found themselves tasked with increasingly complex tasks, hardware and software. With the latest tools available, information management has become a powerful resource and a large expense for many organizations.

Information Management is a discipline that promotes an integrated approach to identifying, managing and sharing all of an organization’s Information assets including unarticulated expertise and experience resident in individual workers. Information Management involves the identification and analysis of available and required information, and the subsequent planning and control of actions to develop information/ knowledge assets so as to fulfill organizational objectives. Information Management is not about managing or
organizing books or journals, searching the inherent for clients or arranging for the circulation of materials. However, each of these activities can in some way be part of the Information management spectrum and processes. Information Management is about enhancing the use of organizational information through sound practices of information management and organizational learning. Thus, Information Management is a combination of Information Resource Management, Communications, and Human Resources.

The purpose of Information Management is to deliver value to organization. The basic goal of Information management is to harness the Information resources and capabilities of the organization in order to enable the organization to learn and adapt to its changing environment. Managing Information goes much further than capturing data and manipulating it to obtain information. Therefore it is mainly the acquisition, recording, organizing, storage, dissemination, and retrieval of information. Good information management has been described as getting the right information to the right person in the right time, from the right source, in the right amount, in the right order, in the right form, in the right medium, with optimal accuracy, as quickly as possible and at the lowest reasonable cost.

The Common Goal and Collaborative Partnership for Information Management

For efficient, effective Information Management, the information handlers should come forward to collaborate. None of us have the capabilities do it all, of even to know it all. No person is an island. Cooperation is a key theme for the future, and all information handlers are going to have to function as collaborators. We will have to collaborate with others... and not only with people we know or people who come to use the services over and over again.

The concept of information and information management information -based systems forge new collaboration and partnerships that bring together the organization's capabilities to create and use information, organize information, and build infrastructures that enable the effective management of information. Three groups of experts who need to work together as teams of information partners are at the heart of the information center. They are users, information professionals including librarians, and technology experts.

User - Information Partnership for Information Management:

Users are the individuals in the organization who are personally involved in the act of creating and using information. Users, including the professionals, technologists, managers, and many others apply the right information to do the right job. The knowledge and expertise they have is specialized and focused on the organization's domain of activity. Through their coordinated effort the organization as a whole performs its role and attains its goals. Through their information creation and use, the organization learns, makes discoveries, creates innovations, and undergoes adaptation. Information professionals are the individuals in the information center who have the skills, training and know-how to organize information into systems and structures that facilitate the productive use of information resources. They include librarians, records managers, archivists, and other information specialists. Their tasks include the representation of the various kinds of organizational information; developing methods and systems of structuring and accessing information; information distribution and delivery; amplifying the usefulness and value of information; information storage and retrieval; and so on. Their general focus is to enhance the accessibility and quality of information so that the organization will have an enlightened view of itself and its environment. The information professionals design and develop information products and services that promote learning
and awareness; they preserve the organization's memory to provide the continuity and context for action and interpretation.

**ITE - Information Partnership for Information Management:**

The ITEs (Information Technology Experts) are the individuals in the organization who have the specialized expertise to fashion the information infrastructure of the organization. The information technology experts include the system analysts, system designers, software engineers, programmers, data administrators, network managers, and other specialists who develop information/ knowledge based systems and networks. Their general focus is to establish and maintain an information infrastructure that models the flow and transaction of information, and accelerates the processing of data and communication of messages. The information technology experts build applications, databases, networks that allow the organization to do its work with accuracy, reliability, and speed.

In the intelligent organization, the information of the three groups of users, information managers, and IT experts congeal into a superstructure for organizational learning and growth. In order to work together in teams of users, information professionals, and information technology experts, each group will need to re-orientate its traditional mindset. Users will need to separate the management of information from the management of information technology. Information technology in most cases has been heavily managed, whereas the management of information processes -- identifying needs, acquiring information, organizing and storing information, developing information services, distributing information, and using information - has been largely neglected. Users need to understand that the goals and principles of information management are quite different from the objectives and methods of information technology management. Users could participate fully in these information processes, not just as end-consumers of information services, but as active agents in every activity of the information management cycle, especially in clarifying information needs, collecting information, sharing information, and transforming raw data into useable information. Users should share the responsibility of identifying and communicating their information needs, and not abdicate this work completely to the information professionals (librarians) or information technology experts. The most valuable information sources in the organization are the people themselves, and they should participate actively in an organization wide information collection and information sharing network. IT experts are the most prominent group in today's technology-dominated environment. The management of information technology has remained in the media's spotlight for many years. IT experts have become proficient at fashioning information/knowledge-based systems that dramatically increase operational efficiency and task productivity. At the same time, the same systems are equally well known for their inability to provide more holistic information about processes, subject areas, or even documents. Computer-based information systems concentrate on formal, structured, internal data, leaving out the informal, unstructured, external information that most decision makers require. IT experts need to move the user to the center of their focus -- develop a behavior-based, process-oriented understanding of the information user in terms of their needs and information use dispositions. People in organizations are not content with structured transactional data; they also want information technology to simplify the use of the informal, unstructured information that forms the bulk of the organization's information resources. They also want external data: information to help them understand how the external environment is changing, what other organizations are doing, and how the organization is doing. In other words, users want a web of formal and informal data, internal and external data that are meaningful to them for cultivating insight and developing choices.
The intelligent organization understands that the discovery and use of information can best be achieved through strategic information partnerships that combine the skills and expertise of its users, librarians as information professionals, and IT experts. This collective synergy is necessary to weave an information tapestry that draws together structured and unstructured, internal and external, as well as historical, current, and future-oriented information; to create the tools and methods to access information and select the best available information sources; to design information architectures based on a rich understanding of users' information and communication requirements; and to integrate the organization's information processes into a springboard for organizational learning and development. Through strategic information partnerships, the intelligent organization can significantly enhance each of the information processes that make up the information management cycle.

**Information Professional - Information Partnership for Information Management**

Information Management has emerged as a key concern of organizations. Librarians have long been regarded as part of the support staff of the organization, working quietly in the background, often uninvolved in any of the critical functions of the organization. In other words, librarians need to work as Information worker. Information work is characterized by variety and exception rather than routine and is performed by professional or technical workers with a high level of skill and expertise. So those who exercise their intellects in any of these types of activities are information workers. If librarian's work can be or is totally routinized, then they are an administrative worker (for example, gatekeeper), not a information worker. That means that librarian's roles should be not limited to being the custodians or gatekeepers of information. Information professionals will have to move from the background to the center of the organizational stage, to jointly hold the reins of information management with users and the technology experts, to help steer and shape the information policies, structures, processes, and systems that will nurture organizational learning. Information professionals should be able to extract, filter and disseminate vital external information. They also will design and develop workgroup application suites that are effectively platforms for information management. Finally, they will work side by side with users in collecting and analyzing strategic intelligence; and to act as trainers and consultants who transfer information gathering and research skills throughout the organization.

**Conclusion**

Information Management is now becoming necessary and it is no longer simply materials and handling techniques that libraries deal with. It is an independent body of knowledge and sophisticated structures that are at the heart of the organization. It is of central importance to most aspects of life in information based society. This study described the notion of information and information management and investigated the roles of librarians as information professionals for obtaining an organization goal. The information professional position will continue to evolve as the information infrastructure develops. The precise role of the information professional will depend on the organization structure and information needs. The emphasis in roles of information professional will likely change according to the needs of the user community and the level of technological sophistication.

Abstract: This paper reports designing of a prototype union catalogue of ETDs on health and medicine through the application of metadata harvesting from OAI-PMH compliant ETD repositories and in turn this union catalogue will act as a single-window search interface to facilitate retrieval of ETDs on global scale and to encourage resource sharing in the digital arena.

Keywords: ETD, ETD union catalogue, Interoperability, Metadata harvesting, OAI-PMH.

Introduction

ETDs stand for Electronic Theses and Dissertations. Generally digitally/electronically submitted Theses and Dissertations (TDs) are called ETDs. TDs are the intellectual outputs of scholars¹ and represent academic heritage of an institution. TDs in paper format and Electronic Theses and Dissertations (ETDs) in electronic/digital formats are valuable academic resources. Therefore, it is essential to archive, preserve and disseminate these intellectual outputs. But these valuable resources are underutilized due to lack of suitable access system. Since long time, libraries have stored and circulated these TDs through manual processes and in most of the libraries these resources are lying obscure. Efforts have been increasing across the globe to enhance accessibility and visibility of TDs. Library automation and Internet has changed the whole scenario of academic sector including the management of TDs and as a result higher academic institutions are developing their own ETD systems. At present, a large number of institutions are investing money, man-hours and efforts in creating, archiving and disseminating ETDs in institutional repositories. These ETD systems are developed by using different software (e.g. DSpace, EPrint, Fedora, Greenstone etc.). But without a good retrieval platform, full texts and even citations of these scholarly works will not be accessible through different digital channels including Internet [¹]. Universities including medical institutes are in the process of opening up their treasures of knowledge which are in the form of ETDs. But without access to recent international scholarly works and without the ability to contribute to national research results, scholars of Medical sciences in the developing countries are struggling to make an impact in their discipline [²]. The development of interoperable ETD systems in Medical sciences may solve this problem; these ETD systems are designed and developed by using different software platforms, different metadata schemas/content designators and different retrieval models. Fortunately Open Archives Initiative Protocol for Metadata Harvesting (OAI-PMH) compliant open source software have solved this problem. Moreover installation bases of these software are commendable. These archiving software differ significantly in scope and retrieval features. So, users need to be accustomed with retrieval features of these digital archiving systems used in building ETD repositories in

334
health and medicine. In this context, authors of this research report have designed a prototype union catalogue of ETDs on health and medicine as a single-window search service to facilitate retrieval of ETDs on health and medicine on global scale. This prototype is named as UniMed and service is available through high-speed network connectivity in the Intranet environment of the University of Burdwan. UniMed is designed by automatic metadata harvesting from distributed ETD systems, through the application of OAI-PMH version 2.0 [3]. The aim of this union catalogue is to build an easy-to-use search service for providing access to databases of worldwide ETDs along with scholarly literature on health and medicine and foster resource sharing in the digital library system.

**ETD**

ETD is an acronym of Electronic Thesis and Dissertation. It is a new genre of document. ETD is digital document which is similar to its paper printed counterpart, only difference is, ETD is prepared digitally. Generally, there are two types of ETD first one is digitally/electronically prepared and submitted TD and second one is scanned paper printed TD, which is called retrospective conversion. According to UNESCO ETD Guide, “An ETD is a document that explains the research or scholarship of a researcher/student. It is expressed in a form simultaneously suitable for machine archives and worldwide retrieval. The ETD is similar to its paper predecessor. It has figures, tables, footnotes and references. It has a title page with the author's name, the official name of the University, the degree sought, and the names of the committee members. It documents the author's years of academic commitment. It describes why the work was done, how the research relates to previous work as recorded in the literature, the research methods used, the results, and the interpretation and discussion of the results, and a summary with conclusion.” (http://etdguide.org/).

The advantages of ETDs over paper printed TDs are numerous and also discussed by several authors such as [4] [5] [6]. These are stated below:-

- ETD submission has less cost in comparison to submit paper printed TDs;
- ETD prevent duplicate efforts in research works;
- ETDs are more frequently and simultaneously accessed by multiple users at a time at 24×7 modes but increased use does not require extra library staff;
- Highly expressive multimedia application is possible in ETDs;
- ETDs helps academic institutions to implement digital library services;
- Implementing ETD systems enhance status and prestige of the Library; and
- ETDs save library space as well as money and man-hours by eliminating much manual process.

**Objectives of the study**

The objectives of this study are:-

- to design a prototype union catalogue of ETDs on health and medicine by using open source software and open standards;
- to facilitate retrieval of ETDs on health and medicine on global scale by single-window search service;
- to encourage designing of OAI-PMH-compliant interoperable ETD systems;
- to encourage resource sharing in the digital library environment; and
- to promote access to ETDs through enhancing visibility.
Scope

OpenDOAR (Directory of Open Access Repositories) (see http://www.opendoar.org/find.php?search=&cIID=&ctID=6&rt&ID=&cID=&IID=25&SoftWareName=&submit=Search&format=summary&step=20&sort=rName&ctrl=new&sp=1) was consulted for selecting ETD IDRs on health and medicine. Selections of ETD IDRs are based on carefully crafted criteria, that is IDRs must have English language ETDs and should have valid OAI-PMH base url. An exhaustive review and harvesting of existing ETD repositories on health and medicine is out of the scope of this paper. It is a prototype archive.

OAI

OAI is an acronym of the Open Archives Initiative. The Open Archives Initiative (OAI) is an international consortium, formed by a broad range of researchers, librarians, publishers, and archivists whose ultimate aim is to create simple standards to support interoperability among digital repositories by metadata harvesting [7]. The OAI is dedicated to solving problems of digital library interoperability [8]. "Open Archive' defines information access at free of cost and without any restriction (with proper acknowledgement). The Open Archive Initiative means an Open Archive, which implements OAI Protocol for Metadata Harvesting to allow remote archive to access its metadata using an open standard. A Repository or IDR is synonymous to an Open Archive. In the context of OAI, a Repository or IDR should be network accessible that supports OAI-PMH.

The roots of OAI work lies in an effort to enhance access to e-print repositories. OAI can be mentioned as a lightweight transport mechanism to expose and disseminate metadata, based on standard technology for transmission of contents and discovery [9].

Interoperability

Interoperability refers different aspects of archive initiatives e.g. metadata formats, architectural framework, and their openness to create third-party digital library services, their integration with current process of scholarly communication, usability in cross-disciplinary context etc. [10]. Interoperability among repositories provides benefits to the scholars that use them.

Some definitions of Interoperability are given below:-

"Interoperability is the ability of multiple systems with different hardware and software platforms, data structures, and interfaces to exchange data with minimal loss of content and functionality"[11].

"Interoperability is the ability of two or more systems or components to exchange information and use the exchanged information without special effort on either system"[12].

In general, 'Interoperability' can be defined as the compatibility of two or more different computer systems so that they can exchange data and information and can use the exchanged data and information without any kind of manipulation or loss. There are several methods to achieve interoperability; building union catalogue by implementing OAI-PMH is one of them.

OAI-PMH

In the context of digital library, implementation of OAI-PMH enhance discovery of Web-based resources and extend the aim of traditional descriptive cataloguing in the digital environment. The OAI-PMH released in an attempt to address interoperability problem among the many existing and independent IDRs. The aim of this Initiative was on high-level
communications among repositories and the simplicity of protocols [13]. OAI-PMH has two components - Data Provider, Service Provider. It also defines six 'verbs' (e.g. Identify, ListMetadataFormats, ListSets, GetRecord, ListIdentifiers and ListRecords); these 'verbs' are used as syntaxes to interact between these two components. Data Provider exposes its metadata for harvesting and Service Provider harvests exposed metadata and stores it locally and on the basis of the harvested metadata provide services to end users. A Data Provider archive must satisfy some basic requirements - the archive must have an online interface and a web server that can be used for the purpose of protocol. The basic purpose of this protocol is incremental bulk transfer of metadata which is called harvesting and harvested metadata are used as resource discovery tools. Here, the system attempts to design union catalogue (a single-window search service) of ETDs on Health & Medicine through harvesting metadata from participating ETD IDRs. It is important to mention here that this union catalogue only provides access to metadata it does not provide the resources themselves. However, every retrieved record against a search displays hyperlink to full-text object (available in the archive where it uploaded) along with bibliographical information. The union catalogue archive of ETDs on health & medicine is designed to function as both Service Provider and Data Provider. The interaction between Service Provider and Data Provider may be represented schematically as in Fig.1.

![Fig. 1. Functions of Data Provider and Service Provider in OAI-PMH Framework](image)

**Designing harvesting framework for union catalogue**

The following steps are required for design and development of harvesting framework for health and medicine ETDs. There are three major steps -

i) Software framework development; ii) Selection, installation and configuration of harvesting tool; and iii) Selection of ETD repositories and collection of essential attributes for harvesting (name of the IDR, resource URL, base URL, etc.); PKP has been used as harvester to design this system.

The prototype harvesting framework for ETDs on health & medicine, named as UniMed, is based on open source software and open standards. This framework is based on Linux-Apache-MySQL-PHP/PERL (LAMP) architecture. Details of designing harvesting framework already reported by the authors in their article published in journal Annals of Library and Information Studies in the December issue of 2010 [14].

As a whole, the use of the open source software in developing the framework depends on a structured methodology. The steps related to the process of the designing harvesting
framework may be divided into three major groups [15]. These are as follows -

Group A: LAMP related activities;

Group B: Harvester related functions.

This group includes two major steps:

- Installation of PKP harvester.
- Configuration of PKP harvester.

Group C: Repository related activities.

The most important task of the administrator is to set up archive(s) for metadata harvesting. The UniMed started with fourteen OAI-PMH compatible open access IDRs containing ETDs of health and medicine. ETD repositories were selected on the basis of carefully crafted criteria; i.e. IDRs should have ETDs in English language and must have valid OAI-PMH base URL. For this research project, OpenDOAR was consulted for selecting ETD IDRs and collected following information e.g. name of the repository, their URL and OAI-PMH base URL. At present, OpenDOAR listed seventy ETD repositories on health and medicine; out of seventy, forty six repositories are of English language and thirty two ETD repositories (English language) have OAI-PMH base URL. Out of forty six English languages ETD repositories continent wise position of ETD systems on health and medicines are as follows Australasia four; Asia eleven; Europe twenty one; North America ten. In Asia, total ETD repositories are fourteen and out of fourteen repositories eleven possess English language ETDs. Asian country-wise distribution of English language ETD systems are as follows Korea Republic one; Bangladesh one; Taiwan two; Japan three; China one; Indonesia one and India two.

UniMed has so far harvested metadata from fourteen IDRs and agglomerated a total of more than seventy three thousand (73,000) open access scholarly materials including ETDs of health and medicine (due to space constraint details of harvested ETD repositories are not listed here).

Some snapshot of UniMed is given below. Fig. 2 is a snapshot of metadata harvesting. Fig. 3 is a snapshot of search queries. It supports localized searching in two modes simple and advance. End-user can limit in a single repository or group of repositories. Search can be

\[\text{Fig. 2. A snapshot of harvesting}\]
filtered by Dublin Core Metadata Element Sets like title, author date range etc. Fig. 4 is a snapshot of browsing ETD archives of health & medicine. The harvesting was conducted during the period from 16th August to 15th September 2011.

**Conclusion**

UniMed is a localized single-window resource discovery tool for ETDs that can harvest and update metadata from various OAI-PMH compliant open access ETD systems on health and medicine. This system has the capability to include new OAI-PMH compatible ETDs of any kind of subject and update existing records for a comprehensive single platform local search service open access IDRs containing ETDs on health and medicine and foster resource sharing in the digital environment. Limitations of this study are that, in spite of having OAI-PMH base URL, harvesting of some repositories was not possible though repeated efforts were made. This may be because of invalid OAI-PMH base URL or may be the non-availability of required data transfer speed in network domain.

Marketing of Library Services

Piyali Ganguly
Library Trainee, Libsys Ltd. Kolkata

Abstract: This paper discusses about the marketing of library and information services in the global era. It discusses about the marketing concept of today's library and information centres covering various topics such as management of libraries and commitment to customer's satisfaction. It defines the marketing & its current approach to library & information services. It's also discuss about the need of LIS marketing, marketing as a philosophy, strategic planning for LIS marketing, customers' expectations, priority, relationship, consumer analysis. It is also discuss about the 5 Ps of marketing mix, i.e. Product, Price, Place and Promotion. The marketing should aim at effective library and information services. In the modern age, the library and information services are user oriented. Therefore, users' priorities, expectations and needs should be taken into account. It is concluded that the modern libraries are information markets and the library users are consumers of information. The ultimate objective of the marketing of library and information services should be the dissemination of the right information to the right user at the right time.

Introduction

Marketing is frequently viewed as a set of strategies and techniques that belong to administrators outside of librarianship. However as librarians we are all involved in the process of marketing. The challenges to library services from changes in educational approaches, the impact of technology, new methods for information provision and declining budgets have meant that marketing is now so essential that it cannot be considered a separate function. Many libraries have come to appreciate the contribution and application that marketing concepts can make. Marketing is a process which carries goods from producers to ultimate consumers. Marketing, in its broader sense, is the social instrument through which the material goods and culture of a society are transmitted to its members. Marketing, in the library context, refers to those instrument through which information both raw and processed are transmitted to its members. According to Kotler, "Marketing is the analysis, planning, implementation and control of carefully formulated programs designed to bring about voluntary exchanges of values with target markets for the purpose of achieving organizational objectives. It reties heavily on designing the organization's offering in terms of target markets needs and desires, and on using effective pricing, communication, and distribution to inform, motivate, and service the markets." Marketing of Library services is the process of planning, pricing, promoting and distributing library products to create exchanges that satisfy the library and the customer.

Marketing Meaning

There is a new meaning of marketing in library and information sector. There is still considerable misunderstanding in most of the library and information sector as to what constitutes effective marketing. To some, it is still primarily equated with selling and the pursuit of sales, rather than customer satisfaction. Many libraries are still reluctant to make the change necessary to focus on the marketplace, even when the need for more active marketing is generally agreed. As such, the developing marketing initiatives of libraries and
understanding of the total marketing concept among library and information professionals need some basic marketing frameworks that they have taken so far.

**Needs for LIS Marketing**

According to Ranganathan's 5th law "Library is a growing organism". Due to global information explosion, more information comes every second and today's information is old very fast for tomorrow. Libraries continue to face continuing changes in the environment strategies and outcomes. Library services have long been perceived as free. But in Today's modern economy nothing comes free. Libraries are in business of providing information services to its clientele. Thus the libraries core activity resides in the intangible services of facilitating access to information and they seek to influence the use of their services. According to Kotlar, "organizations become aware of marketing when their market under goes a change. When buyers, members, funds or other resources need by the organization get scarce or harder to attract, the organization get concerned."

Today libraries are facing a whole lot of problems; their funds are shrinking, cost of resources like Journals, etc. are increasing rapidly and reading habits among people declining due to reasons such as onslaught of television and internet. A study conducted by Oldman had identified some of the reason why people do not use libraries:

- It is quicker to obtain information from sources other than the formal systems.
- Talking to people is regarded as preferable to reading books.
- Individuals do not realize that they have an information problem.
- Potential users are not aware of the library's facilities.
- Users have had bad experience with past or present service.

Today we leave in era of competition. Library's competitors include Internet, Television, FM Radios, Exhibitions, Fairs, Leisure services, Holiday services, Computer games, Family retreats, Sports events, etc. The library & information services sector operators in an environment which is undergoing constant evolution and change. Library service professionals are realizing that the delivery of effective services must be based on strategic planning. Today's libraries need a marketing knowledge to operate effectively. Snoj and Petermance give the following reasons for the libraries to have marketing strategies:

- To improve their organizational status.
- To develop new services or change existing ones to satisfy their users.
- Improve their performance in general like timely procurement of books.

**Marketing as a Philosophy**

It was less than three decades ago that marketing came into the field of library and information services. Integration of marketing into library philosophy is helpful in reinforcing and reiterating the basic values of the profession in a changing environment. In one sense, it implies commitment to shared professional beliefs. The most widely agreed beliefs are about library services "to provide the right information to the right user at the right time". This involves reducing barriers to access and use information and empowering users in making use of their own, particularly with the use of modern technologies.

Marketing help us the following aims of the library and information services:

- A focus on the users own purpose and on helping the individual user to articulate these at every level.
A focus on the users, giving them an environment in which they can sit, study, work and on giving them an experience of good service.

A belief that every individual user has different needs, requirements and expectations when s/he visits/approaches the library.

A commitment to helping the user in acquiring skills in obtaining the information from various sources and means.

**Strategic Planning for LIS Marketing**

Strategic planning is the process of defining the purpose and pursuits of an organization and the methods for achieving those. Strategic planning is required for achieving success in marketing on sustainable basis. Strategic planning involves formulation of vision, mission and goals setting.

A vision statement describes what the organization is to become in the future. Thus, vision is a statement about what your library wants to become. It should say what you want to see at certain point in future. A vision should stretch the library's capabilities and image of itself. It gives shape and direction to a library in coming times.

Mission reflects the essential purpose of the organization. In the other words, while the vision statement says 'where we will be going', the mission statement will say 'how we will get there'. The mission statement flows directly from the vision statement.

Goals represent the desired general ends toward which efforts are directed while objectives are specific and often quantified versions of goal.

It is essential that libraries need a proper strategy for successful marketing and to meet its objectives. The key elements of such strategy are:

- Understand your client.
- Identify your client market.
- Identify your strengths as a competitive business.
- Know the products your clients want and where they want to use it.
- Develop effective and efficient procedures and systems that facilitate outcomes for clients.
- Employ and train staff in both work skills and client relationship marketing.
- Communicate the benefits and advantages of your product over competitors, such as chaos of the internet.

**Customers - Top Priority**

The new customers do not know about library rules and regulation, therefore it is duty of library staff to give orientation for maximum utility of library. They do not care about rules and ways of doing business. They care to adapt its products and services to fit their problems. This represents the evolution of marketing to the customer-driven. We must always remember the following points:

- Customers are the most important people to be served in library and information centres.
- They are not dependent on the library; rather the library depends on them.
They are not just from outsiders but part of the library.
They are not just statistics, but also they are human beings.
They are the people who bring their wants and needs and we are there to meet their information needs exceedingly.

Customers - Expectations

Library and information professionals should strive hard to gain a far vision of 'who our customers are', 'what they want', and 'what are their social characters, values, desires, and aspiration'. The advancement of information and communication technologies has enabled education and technology in self-help and do-it-yourself activities in libraries. The 21st century customer will place high value on self-reliance, adaptability and survival under difficult conditions and the ability to do things of his/her own.

Consumer Analysis

Too many assumptions are made by librarians about the consumers. Examples are given below:
- Collections of books and resources is inherently desirable
- It is in the user's own interest to use the library.
- Library needs to have all old classics.
- Our scholars are too proud to visit the library.
- Library has to be located in the most silent corner in the campus, user's convenience is secondary.

Relationship

To measure customer satisfaction, the relationship between the customer and the library must be understood. A customer relationship comprises of a hierarchy of encounters through facilities, resources, services and service providers.

According to Ranganathan:
- Give service with full attention and sincerity.
- Give him/her service to the best capacity at your command.
- Give him/her service in all modesty and in full freedom from any touch of prestige or ego.
- Give him/her service in full measure there should not be any offence to the laws of library science.
- Acquire the best knowledge and information for giving him/her your best service. We cannot retain customer unless given prompt and relevant service in a personal way. She/he is human; and human personality alone can keep good humor, make the appreciation of the value of books which blossom in him/her and transform him/her into a willingness beneficiary of the library.

Marketing Mix for LIS

Marketing today embraces an integrated value proposition. This in effect, would mean that with making a decision about using a particular service or evaluating a marketing
relationship a customer not only looks at the product or value related to it, but she/he also evaluates the process, the total transaction cost. Marketing mix is the blend of four “P’s” namely PRODUCT, PRICE, PLACE, & PROMOTION, used to reach a target market.

- **Product:** Information resources and research services.
- **Price:** Free to employees. In other words, company sponsored. This is particularly important in an R&D environment where research budgets are tight and the company may not realize Return on Investment (ROI) in a project for some time.
- **Place:** Not necessarily a physical location anymore. A strong web presence is necessary. Libraries are virtual as well as physical spaces now and the possibilities in both these worlds are endless.
- **Promotion:** Internal bulletins, e-mails, the company intranet, the library web site, newsletters and poster campaigns are all effective promotional vehicles for highlighting new tools and advertising events.

For the library to remain competitive, or even more fundamentally, to remain relevant, it has to change its image. The new-age library ought to be a true service organization, a group of professionals who quickly identify in the vast ocean of knowledge the kind of information that different customers need and help them access it with the least waste of time and effort. A library that can survive and thrive in the Internet age is a knowledge-based social structure.

**Conclusion**

The modern library is now generally called an information market and the library user is a consumer of information. Information is a vital resource for research and development of any nation. Today user has many options with regard to accessing timely information. The rapid growth of internet has especially changed the information paradigm. To continue to remain relevant, libraries need to market their services as per the target market needs. Marketing is essential in making the proper planning, designing and use of such services and products for the better and optimal use of information. The library should give priority to provide excellent customer service enhancing its image as information provider in the information era. The library and information services should be user oriented in order to satisfy their information needs effectively. Marketing of library and information services includes customer (users) priorities, expectations, individuality, responsiveness, relationship, quality of services, professional skills and competencies, value-added services, etc. The ultimate aim of marketing here is to provide the right information to the right user at the right time.

Abstract: Since Internet became in the last years the biggest source of information as open sources and free market and commonly reachable for the educationalist in higher and further education systems, the book concept has been dramatically redefined for higher education and further education, especially in terms of separating of its content and the related support. Practically, when using the electronic media, a book could take a different look-the electronic book (e-book). Due to their widely spread in the last period, the e-books are one of the most effective ways to support distance learning (e-learning), as they can be read by thousands of readers. Due to the fact that the teachers have limited time for participating to the face-to-face training programmes, the e-books became an important tool for promoting different training courses organized in the frame of various projects. The various types of engagement in digital libraries (DLs), such as funding developmental stages or devoting important shares in the acquisition of access has drawn considerable attention to the evaluation of these systems during the late period. The term digital library is vast, covers many and different applications and has been used interchangeably for systems, like digitized collections, e-journals platforms, network databases, library websites, etc. Moreover the current electronic publishing business models enrich the DL technology aiming to provide powerful information access options to the users. The best practices and experiences of the teachers who achieved the on-line courses were collected and help the partnership to design a web-guideline entitled “Best Practices Guideline for Educational Use of ICT Tools” as a final output of the project. The content of the European course and the web-guideline have been produced as an e-book format by using Desktop Author software application. In this sense, the paper aims to present the most important features proposed by Desktop Author software during the design process of the mentioned e-books, together with the main facets presented by the related e-volumes. The advent of electronic books (e-books) has significantly impacted the publishing industry in recent years. The prevalence of e-books has prompted many publishers to reconsider their distribution channels for new titles. They need to decide whether to sell the e-book version of new titles. We derive the conditions under which a publisher should sell only printed books (p-books), only e-books, and both of them simultaneously.

1. Introduction

Over the past decade, the rapid developments and growth of information and communication technology (ICT) in such areas as education and training has offered new paradigms for university training and the topic of electronic learning (E-learning) has deserved careful attention. Internet technology is presently enabling humankind to communicate with anyone, anywhere, and anytime globally, instantaneously and yet inexpensively. Such an excellent communication tool can be put to good use in education.
The application of ICT in education is now making it possible for education to transcend space, time and political boundaries. The growing literature on E-learning education shows how technological, economic and scientific factors are contributing to the development of a new educational panorama. The different teaching contexts to meet different learners’ preferences and needs produce outcomes for students which go beyond simple subject teaching. E-learning programs are uniquely different around the world. The situation is distinctly different across countries. The most recent estimate that more than two-thirds of all higher education institutions now have offered E-learning courses, with the majority of these provide programs that are fully online. Currently, the overall E-learning students have exceeded to 3.5 million in 2007. The number of online students is still continuing to expand, with a compound annual growth rate of 21.5 percentages.

A significant body of literature indicates the dramatic changes in the higher education systems caused by the diffusion of new ICT’s, as well as the need for universities to radically change in order to stand both the social pressure and the competition from online universities. The advantage of E-learning is clear. For instance, Kirschner et al. (2007) indicate that E-learning matches the needs of nontraditional students, increases the educational facilities available to traditional students, provides companies with cost efficient yet effective training options, and gives students and researchers in developing nations an invaluable means of gaining a first-world education tempered by third-world experience.

2. Knowledge Management, innovation and lifelong learning

Knowledge management, innovation and lifelong learning are in the forefront of global economic development, while investments in education become a key indicator of understanding the dynamics of contemporary business and society. In today’s economy, companies face increasing pressure to cut costs and provide customers with high levels of quality they expect. In this context, e-learning represents an almost ideal approach for a flexible and cost-effective competence development since it can be used without restrictions related to physical location and time of usage. However, it is not enough to develop an appropriate curriculum and implement it through an e-learning system, given that e-learning needs to be appropriately integrated into the overall system of human resource management. The same issue is relevant for educational institutions, as well: a fundamental problem of many different approaches to e-learning implementation is the assumption that the uses of modern technology pursue means automatic and significant progress towards achieving the learning goals. Often enough, it is considered that it is sufficient to “integrate” technology solution in the process of higher and further teaching and learning. However, it is much more than this: the whole process should be appropriately (re)designed. Many authors provide their own definitions of (business) processes. They are all similar and imply that a set of inter-related activities is conducted with a purpose to create results of added value, congruent with the previously defined goals of the business system. With the increasing requirements to provide evidence of effectiveness for all kinds of processes, including higher education/training, it is essential to design and empirically investigate the e-learning process and the factors which influence its performance.

2.1 MIS and Virtual Learning Environments

E-learning has created unprecedented virtual learning environments, offering new educational models that impact the learning industry. These innovative learning environments may impact the traditional education system and render the capabilities of the stakeholders in the system obsolete. From the dynamic capability perspectives, in such a new setting, the stakeholders must constantly reconfigure, renew, or learn new capabilities rather than protect their capabilities along with technology, content, and education delivery
expertise to embrace the educational innovation—E-learning. Understanding the nature of innovation is the crucial first step in managing the change associated with any innovation. In order to understand the nature and scope of the opportunities accompany with the E-learning innovation, it is necessary to organize them categorically and see them fully. It is necessary for E-learning participants to recognize and evaluate changes in the education and technological landscape and speculate on what extent each stakeholder meets the emerging capability gaps in a timely way. Possessing this knowledge is crucial for stakeholders to successfully adapt from the traditional classroom to E-learning environment. However, some disadvantages of e-learning are identified such as lack of peer contact and interaction, high initial costs for preparing multimedia content of learning materials and also substantial costs for its maintaining and updating, as well as the need for flexible tutorial support (Hamburg, Lindecke, & Thij, 2003). In the virtual E-learning environment, students have to be highly motivated and responsible because all the work they do is on their own. Learners with low motivation or bad study habits may fall behind.

2.2 Formats and Evaluation of E-books

E-books are available in different formats, the simplest of which is plain ASCII-standard text. This text is extremely unappealing to read, cannot preserve formatting, and cannot handle graphics. Microsoft Reader e-books are compatible with Windows 95/98/2000/NT desktop and laptop computers as well as pocket PC handheld devices. Adobe reader e-books are compatible with Macintosh, Windows computers, as well as palm PDA’s. Adobe Portable Doc Format (PDF) is the open de-facto standard for electronic document distribution worldwide. PDF files are compact and can be shared, viewed, and navigated easily. Gemstar e-books are designed for the Gemstar e-book RCAREB1100 or the Pocket e-books. These e-book reading devices come with their own e-book reading software. Palm e-books can be read on one’s own palm handheld device. Palms allow one to carry as many e-books with oneself as the memory allows. The Mobipocket Reader format is the universal e-book Reader for all PDA’s and brings a wide range of e-reading technologies to choose from—Palm series (Palm OsV2.0 and onward), Windows CE, Pocket PC, Franklin e-BookMan, as well as Windows PC’s and Windows tables.

3. E-learning process

An e-book is typically an electronic equivalent of a conventional printed book but allows access in libraries more through a subscription model as followed for journals. The term “e-book” is used to refer either
to an individual work in a digital format or a hardware device used to read books in digital format, more specifically called an e-book device or e-book reader. Andrew Cox and Heba Mohammed define an e-book as a term used to describe a text analogous to a book that is in a digital form to be displayed on a computer. An e-book comprises any book or monograph-length sequence of text made available in electronic form. It is the presentation of electronic files in digital displays. The benefits of electronic books for libraries are

- The ability to provide secure access to users 24/7;
- Checking out a book by one person may not prevent another user from accessing the same content;
- E-books are freely searchable for any word/phrase throughout the text;
- Little investment in technology (hardware, software and network) infrastructure is needed;
- No additional shelves are required; and
- Staff members are not required to have technological caliber of high order for providing e-books services to the users.

3.1 Searching and Navigation

Full-text searching and navigation are facilitated within the book, as well as across the collection, and this feature is common among all offerings. These electronic books collections provide hyperlinks to additional resources which is an important feature too. All four collections provide browsing and bibliographic searching. They also provide basic bibliographic information on the search results page for each e-book retrieved.

3.2 Printing/Downloading

Springer permits complete printing and downloading once the perpetual ownership has been bought. Taylor & Francis allow just 5 percent (printing and downloading of the text). Thomson permits complete 100 percent printing and downloading. Wiley permits complete downloading of contents.

4. E-learning model and E-learning innovation

The E-learning model is based on the technological infrastructure and content, that is, it could becomes a good design function by making the core design knowledge concrete. A learning model is the way in which the core components are built by integrating the components and linking them into a coherent whole to support learning processes. A learning model is further described as consisting of educational environments, course development, teaching and learning, faculty/student interaction, collaborative learning, and evaluation and assessment (Tennyson, 2005). The possible changes in E-learning innovation can be categorized into four types: incremental, modular, architectural, and radical. The classification is based on the intensity in which change overturns the existing technological components and learning model. An E-learning innovation is incremental if it conserves (or reinforces) the existing technological components and learning model; modular if it decreases technological components but conserves (or reinforces) the learning model, architectural if it decreases the learning model but preserves (or reinforces) the technological components, and radical if both the technological components and learning model become obsolete.

Information and Communication Technology is the driver of the New Economy, and human capital is its fuel. In today's world, not only does knowledge make the difference in
how an individual performs but it also makes the difference in how well a company performs and, of that matter, how well a country performs. According to the innovation of the learning environment, it needs a greater involvement of institutional partnerships. Human capital is the fuel to prompt the success from the traditional learning environment to E-learning. Today’s learning and E-learning partnerships include a much wider range of nontraditional educational enterprises. ‘Partnership and alliances among stakeholder’s national and institutional policy-makers, teaching and related staff, researchers and students (i.e., learners), and administrative and technical personnel in institutions of higher education, the world of work and community groups are a powerful force in managing change” (UNESCO, 1998). For the purpose of this study, the E-learning stakeholders include E-learners, E-instructors, and educational institutions. E-learners are existing or potential learning end users. E-instructor is the teacher who develops courses, provides learner support, and provides evaluation and assessment. Educational institutions provide the platform, services and environment for learners and instructors to obtain what they need.

4.1 ICT Support for E-learning Technological Infrastructure

An ICT can promote educational innovation and modernization. Technological infrastructures could integrate the core design concept and all participants in the process of network learning service delivery. We compared traditional classroom learning and E-learning based on network infrastructures, application platform, and devices as argued in prior research. Technological improvements in education have taken many forms over the centuries; innovations like radio, television, recorded audio-tapes, CD-ROM products, and computer networks literally have influenced students’ learning and instructors’ teaching methods. In recent years, several innovative Internet technologies such as Web 2.0 and open source applications have been applied in the development of E-learning systems. Table 1 summarizes the comparison result, which shows that E-learning could provide geographical freedom, temporal freedom, unlimited class size, and change the way of interaction and learner control.

* Technology Mediated Learning system (e.g., Streaming Multicast System, Virtual classroom)
For network infrastructures and application platform, the E-learning environment has momentous differences from the traditional classroom learning because the network infrastructure is not required for the later while they are necessary for the former. However, the difference in devices is not significant.

                         2. Select instructional activities & media element | 1. Instructor-centered courses  
                                                                                         2. Different material about the same subject  
                                                                                         3. Be characterized by the class (active in full time) | 1. Student-centered courses  
                                                                                         2. Consistent content  
                                                                                         3. Updated easily and quickly  
                                                                                         4. Be personalized for the learners |
| Teaching and learning | Instruction interaction | 1. Lecture-centered teaching & face-to-face learning  
                                                                                         2. The student plays a reactive role in the in presence paradigm  
                                                                                         3. Just-in-time feedback and interactions | 1. Online learning and teaching  
                                                                                         2. The learner assumes a proactive role in the distance modality  
                                                                                         3. Self-paced *  
                                                                                         4. Encouraging interaction with other e-learners and e-instructors  
                                                                                         ** all offer effective interaction for e-learner. |
| Interaction         | 1. Student content  
                         2. Student instructor  
                         3. Student student  
                         4. Student technology | 1. Face-to-face course material delivery  
                                                                                         2. Interpersonal contact  
                                                                                         3. Synchronous interaction and feedback  
                                                                                         4. Courses design trend to individual work | 1. Online course material delivery  
                                                                                         2. Indirect contact (human computer interaction)  
                                                                                         3. Asynchronous and synchronous interaction and feedback  
                                                                                         4. Courses design involves a high degree of team work and encourages arrangement to cooperative learning |
| Collaborative learning | Group collaborative learning | Limited in time and place | 1. E-learning provide digital collaborative learning environments to continue learning  
                                                                                         2. Geographical and temporal freedom for collaborative learning |
| Evaluation and assessment | 1. The track of instruction schedule progress  
                         2. Evaluation & assessment | More time-consuming | 1. Efficiency and convenience in scoring, aggregating results, and assessment management  
                                                                                         2. Quizzes and exams customization, *** |

* (e-learning courses can be taken when they are necessary)  
** (chat rooms, discussion boards, instant messaging and e-mail)  
*** (Using intelligent algorithm to generate quizzes and exams with different levels of difficulties.)
4.2 E-learning Environment and Core Capabilities for Educational Institution

Actually to build an E-learning environment, it is critical to erect common platforms and service standards that include support for interoperability and transparency. The development and implement of technological components are major topics for educational institution administrators. Indeed, E-learning is creating unparalleled learning value and opportunities for E-learning stakeholders to influence the benefits. To this end, identifying the user value frontier and conveying new value propositions to market should be given a high priority. Because of the chain of different stakeholders involved in an E-learning environment, configuring new strategic alliances and implementing inter-education institution collaborations with them would become increasingly important. Educational institutions must critically position themselves at advantageous locations in viable value networks in order to gain access to core competencies and maintain existing advantages. Table 3 summarizes the capability for education institution administrators.

Table 3: Summarizes the capability for education institution administrators.

</tr>
</tbody>
</table>

In addition, the following technical capabilities are crucial. First, educational institutions have to re-think their technology planning to satisfy and achieve their pedagogical goals in E-learning environments. The administrators of educational institutions must plan the technology environment for E-learning. Second, the abilities of ICT acquisitions and distribution is often an overlooked or an under specified area of school management. Third, ICT maintenance and user support is needed. In some cases, improper adjustment of those settings causes the entire computer to become inoperable, particularly when access to networks is desired. This is a challenge both to policy and management and to the capabilities of school staff. Teachers cannot get the help they need when they need it, which becomes a strong disincentive to the inclusion of technology in their regular teaching practices. Researchers found that more than two thirds of instructors nationally who reported needing help with technology could not get that help when they needed it. Thus, how to support users to use E-learning system is also an important issue. Finally, spanning traditional boundaries is an important capability. Just as inquiry-oriented and communication technologies pose problems for teachers who must learn to communicate in new ways with new audiences, they post similar problems within educational organizations, forcing communication where none was thought to be necessary before. These organizations had not previously had to cope with the highly interactive and interconnected curriculum and education applications made possible by the Internet in the classroom.
5. Implications of E-learning and E-books

This study utilized the E-learning hypercube innovation model and accompanied it with a secondary data analysis and comparative analysis to analyze the differences between traditional classroom learning and E-learning, investigated the impacts of the E-learning on the E-learning stakeholders, and developed the needed core capabilities for them. The results indicate that the innovation from traditional classroom to E-learning for learners and instructors is radical. The move from traditional classroom learning to E-learning is an overturned innovation in technological components that makes established technical and E-learning delivery capabilities obsolete. This may lead to a drastic overhaul of existing ways of doing education. Thus, an existing E-learning participant must seriously rethink how to rebuild new technological and learning delivery capabilities. Attempting to duplicate the previous technological knowledge and learning model is impractical. For an educational institution, the technological component has a fundamental change, while the learning delivery activities they support are reinforced. To cope with the innovative changes, assisting education institutions to strengthen or reconfigure their technical capabilities to exploit new educational environments should be given a high priority. For instance, the major change in technological knowledge can be facilitated through a combination of four core IT capabilities. Yet, both technological and E-learning delivery capabilities play critical roles in the E-learning transformation. It is helpful to understand what capabilities obstruct an educational institution in the new E-learning environment. Education institutes' administrators should pay attention to improve their learning delivery functions and core capabilities. In summary, the contribution of this study is threefold: First, this research develops a comprehensive E-learning innovation hypercube model and then uses it to analyze the impact of the E-learning and examines the critical differences between them by comparing the features of their technological components (technological infrastructure and content) and learning model. This analysis provides a better understanding of how E-learning will impact the capabilities of E-learning stakeholders: learners, instructors, and education institutions. Second, this research shows that the change derived from E-learning are multidimensional (i.e., technological components and learning model) and identify their critical differences. These two dimensions are interwoven, and one must not focus exclusively on any single factor in assessing overall E-learning innovation. Finally, this research further explores the core capabilities based on the dynamic capabilities perspective for implementing and managing E-learning innovation. It is helpful to understand what capabilities interfere when E-learning stakeholders transition to E-learning environments. This study further provides several inductive results to enhance our understanding and management of E-learning change. These research results can be utilized as a diagnostic tool for practitioners to assess and analyze what aspects of their E-learning applications are most problematical. Practitioners can compare the current level of each element in their learning delivery functions with the expected levels to understand their relative effectiveness or ineffectiveness and take the necessary corrective actions to successfully make the E-learning transformation. The current study is an exploratory research on developing a systemic model to analyze the E-learning innovations. Several issues deemed worthy of future research are mentioned in the body of this research. For instance, the inference we drew from the secondary data analysis and comparative analysis is based on the assumption that further E-learning innovation evolution does not deviate from the expected course herein. It is not easy to exactly recognize the trajectory of the innovations; hence, the limitation of contextual uncertainties may influence the validity of this study. As more and more education institutions implement E-learning; future empirical researches should refine and extend the results and should continue to seek better means of assisting the E-learning transformation to cope with rapid E-learning innovation.
6. Conclusions

E-learning is a highly multidisciplinary field, but it should be noted that research in education science, on one hand, and specific information technology applications, on the other hand, still dominate this area. Technological challenges of the e-learning process are basically much easier to solve than the organizational and methodological ones. Educational institutions must adapt themselves by designing and managing e-learning processes providing quick, targeted, inexpensive and highly flexible information delivery to their users, and thus help in developing their skills and competencies. The e-book collection is intended to supplement the physical collections by extending resource access to the three tiers of the library system and not to replace it. The Library and Documentation Division will also explore options of networking and collaborating with libraries of other educational and research institutions in general and Open Universities in particular for evolving cooperation in providing better access to e-book collections for distance learners. Monitoring usage of the selected resources will lead to a strategy of discontinuing less used ones and adding better ones, thereby optimizing resources. While the library develops and strengthens e-book collections through deliberate considerations, the users' information needs will be strictly kept in view.

Abstract: From the dawn of civil society, marketing has become an indispensable ingredient of the society to bring closure the products and customer. Marketing is a management function which organizes and directs all those business activities involved in assessing and converting customers’ purchasing power into effective demand for a specific product or service and in moving the products and services to final consumer or users so as to achieve profit target or other objectives set by an organization. However marketing for non-profit organizations like school libraries is defined as the voluntary exchange of values (e.g. books for knowledge) with targeted markets (e.g. library user), built upon organizational goals and objectives, that achieve customer satisfaction. As the school library is not merely a physical space in which various media are stored, the marketing of school library explores the ways to promote the use of the school library and also sell the value of school library. This paper explores these ways and also the reasons why this marketing technique is adopted in school library. On the other hand there are various problems faced by the librarian to apply those marketing techniques in the school libraries. So here also an attempt is made to explore these challenges.

Key words: School Library; Marketing; Library Services

Introduction

From the dawn of civilization marketing has become an indispensable ingredient of the society to bring closure the products and customer. It can be established as a process of exchange of relationships in the transaction and marketing of information, through a new horizon in the marketing environment primarily is influenced by perception, environmental, cultural conditions and trends. So the concept marketing is not newly emerges but what is new is the adoption of marketing technique in the library and information centers. In management sense marketing is a management function which organizes and directs all those business activities involved in assessing and converting Customers purchasing Power into effective demand for a specific product or service and in moving the products and services to final customer or users so as to achieve profit target or other objectives set by an organization (Band, 1991).

Libraries and information centers are facing a time of unprecedented change and challenge. Recent technological developments are creating new forms of information, new sources of information and new ways of providing information bypassing traditional institutional like libraries. There has been an increasing pressure on libraries to mobilize resources and become self-reliant. Library users are transforming into customers with rising expectations, diverse needs and wants, and choices. Now, the real challenge for library and information professionals is not to manage the collection, staff and technology but to turn these resources into services. The notion of services has also changed, from basic to value added, from staff assisted to self-service, from in-house to outreach, from free to priced, from reactive to pro-active, and from mass customization to individualized service.
As in such an environment librarians are finding new ways of serving users or customers effectively and efficiently. The principles of marketing have gradually been accepted both as relevant and beneficial to the library environment. Marketing provides an opportunity to see as to how they can offer effective and efficient services to their users or customers. There have been many developments at international level, which have directly or indirectly contributed for the growth and development of marketing in library services in India. That's why the marketing in school libraries is not beyond from this. Today is the time to judge the marketing approaches in the school library. In this study we try find out those possibilities of marketing in school libraries that can be applied as promotional technique of the libraries. Besides this the challenges faced by the librarian of these libraries to promote their libraries are also discussed in the context of our state.

Definition

The concept of marketing is studied through different approaches by different persons. The concept of marketing is defined in the respect of market as well as in the sense of library.

“Marketing is a process which carries goods from producers to ultimate consumers. Marketing, in its broader sense, is the social instrument through which the material goods and culture of a society are transmitted to its members. Marketing, in its library sense, refers to the instrument through which information (both raw and processed) are transmitted to its members.”

According to Kotler “Marketing is the analysis, planning, implementation and control of carefully formulated programs designed to bring about voluntary exchanges of values with target markets for the purpose of achieving organizational objectives. It relies heavily on designing the organization's offering in terms of target markets needs and desires, and on using effective pricing, communication, and distribution to inform, motivate, and service the markets.”

In the words of Stanton, “marketing is a total system of interacting business activities to plan, price, promote and distribute want satisfying products and services, and present to potential customers.”

Dragon neatly defined the concept of marketing and outlined its major aspects as follows 
“Marketing is a systematic approach to planning and achieving desired exchange relations with other groups. Marketing is concerned with developing, maintaining, and/or regulating exchange relations involving products, services, organizations, persons, places or causes.”

Zachert and Williams considered that “marketing is planning that focuses on products, place or mode of delivery, adjustment of cost/price to the market, and promotion to specifically targeted segments of the special librarian's market.”

From these approaches we defined marketing in the context of school library. This is as follow-

“Marketing is anything that libraries do to let the school community know who they are and what they do. Marketing lets the school community to know that the library continues to be an outstanding source of information in a changing world.”

Reasons for marketing in school library

School is the threshold of all educational phases. That's why its library plays a vital role to build up a lifelong learning habit of a student. Besides the students it supports the needs of teachers, other school staff and pupils in all areas of the curriculum-literacy and reading;
information skills and independent learning. There are several reasons why we market the school libraries. In our state school libraries are not so much flourishing compare to other academic libraries. The conditions of most of the libraries still now remain in under developed stage. In this context marketing evolving as an important approach to promote the school libraries to draw the attention of the concern authorities for the development of these school libraries. However there are several reasons to apply marketing strategies in the school library context.

1) To promote school library that mean aware the school community about the library.
2) To know about the new services and resources to offer that will benefit new users or keep current users coming back.
3) Many users may not understand the services of libraries that are offered to the users, marketing help the users to understand the services.
4) What kind of resources library had can be known to the user through marketing.
5) Those populations of student do not use the library can be attracted through marketing.
6) To show to the users about the value of the library.
7) Libraries require money and marketing informs the school community about the value of the library and the necessity of continuing support to the library.

In all around “Marketing lets the school community know that the library continues to be an outstanding source of information in a changing world.”

Marketing strategies in school library:

To market a library, its resources and information services is not difficult. Wolfe's observation, “Library public relations, promotions, and communications: a how to do it manual” is a useful guide for library marketing. However there are following steps may be followed to market the school library-

To carry out these steps, proper marketing strategy should be adopted. Here we applied the 7Ps (Koontz and Rockwood's 4Ps plus Rafiq and Ahmed's 3Ps) of marketing mix. Koontz and Rockwood (2001) suggested that marketing strategy is a comprehensive, integrated and coordinated plan that combines four marketing elements, commonly called the ‘4Ps’ they are: Product, Price, Place, and Promotion and 3Ps of the marketing mix are: Participants, Physical evidence, and Process. Now in the context of school library these 7Ps are described below-

1) **Product:** Here product means library services available to clients. Evaluate all library services, programs, events, collections, etc. that are available and value of these products to customers. In school library there should be a good relationship between the librarian and the student for proper personal assistance. School libraries may develop a relationship between the nearest public library for Inter-library loan service. As in our state ICT based school library is a rare one that's why personal assistance or personal attitude to do the work is important one to provide IT based any type of service which students require.

2) **Price:** Pricing of use of the library is usually that of the time and effort the user spends to use the library, as well as the effort spent. In case of school libraries time is one of the principle factors. For school library there should be a library period in the
class routine. If there is a period then time is restricted that's why librarians should be prepared to provide good service in this limited period as well as librarians should motivate students to use the library in their off period or tiffin hour.

3) **Place**: - Place indicates the delivery and the distribution of the products and services. School librarians should identify the users according to their needs and wants and provide service according to this.

4) **Promotion**: - Promotion refers methods to promote products or services of the library. Proper promotional methods that are available may be adopted by the school
librarians to promote their library. They should discuss about the library in their library class or organize a demonstration class to aware the students about the library.

5) **Participants:** Here participants mean all human actors who play a part or role in the promotion of library. In schools, teachers of the different stream motivate the students to use the library. Here teachers are acting as a participant beside the librarian.

6) **Physical Evidence:** Physical evidence refers the environment in which the library services are delivered. Librarians may built up a good relations with the students to create a proper environment to provide good service.

7) **Processes:** Processes indicates the techniques adopted by the librarian to provide the library services.

**Challenges faced by the school librarian:**

School librarians have to face many challenges. These are some challenges which have been discussed here in below-

1. **Create a positive image**

   School librarians have to create a positive image among students. School librarians have to convince the students about the usefulness of using the library for the enhancement of their knowledge. Students should also be convinced that they can only develop their reading habits through the use of the library. It is the duty of the school librarian to help the students to realize that they should not be able to improve their knowledge by consulting the text books only.

2. **Be proactive**

   Language problems (local languages sometimes not properly understand by the librarians) may hinder users from seeking assistance offered by the library. Some users have to rely on friends rather than librarians for information or instruction. All professional librarians have got to communicate with users about their services because exchanges between the service agent (librarians) and the customer (users) can elicit information about users' requirements. School librarians should have to properly communicate with students so that he/she can properly understand the query of the students.

3. **Build good relationship**

   There is no real shortcut to providing good information services to users. Quality reference service involves a relationship between the user and librarian. School librarians have to create a good relationship with students.

4. **Create a welcoming environment**

   Librarian needs to develop the ability to create a welcoming environment, be patient, and build confidence with the users. When librarians are friendly, and welcoming and helpful, users are encouraged into the library, whereas, in a library where the librarians are unfriendly and lazy, users are driven away. It is reported the personality of the librarian determines the rate of utilization of the library by its users. If she or he is friendly and professional, the user will be convinced that there is an approachable and reliable information expert in that library. If they are drawn to the library by the mien of the librarian, they will then be able to browse through the books and thus become aware of the availability of materials relevant to their studies and research, and the use of the collections increases. So school librarians must have to create a welcoming environment for students so that students could be attracted to the library.
5. Know how to communicate well with users from different cultures

School librarians need to learn ways of styles because the way people communicate varies widely between one aspects of communication style is language usage. Across cultures, some words and phrases are used in different ways. For instance, one user who had huge fines for a book he borrowed because he misunderstood the concept of returning a book. To him, “return” a book means putting it back on the shelf. Don’t assume that the way you are behaving is the “right” way of doing things. Consider a variety of approaches to a procedure.

6. Administrative barriers -

Administration is still now a barrier for flourishing the school library. Though school librarians are appointed for the library but in most of the cases in our state they are pressurized to go to the class of any academic discipline. Besides this librarians faced lots of troubles for financial or other kind of developmental help by the administration to flourish the library.

Conclusion

School libraries in our state are still now underdeveloped stage. Marketing helps the libraries to flourish in a full-fazed way. Though there are several challenges faced by the librarians to overcome this situation but still a positive approach makes a difference. This paper helps the librarians to understand the concept of marketing and how it is applied in the field of school library. Different strategies discussed here helps them to understand or to built up a mind set in what way they make the school library popular to the students as well as helps them to draw a concern of the school authority.

Emerging Trends including Knowledge Management
Prelude

i-tech, we believe, is the highway to success and the panacea for storage and preservation of our national printed heritage. This is an age dazzled by information technology, increasingly given the dimension and impact of the miracles of modern science on our way of life. Our technological capability in computer applications is a focus of our national pride and the symbol of our status in the world due to global acceptance of Indian software. Digital Technology boom is fast becoming an obsession whereas the worldwide demand for Cyber Security is one of the most important concerns for the prevention of unauthorized access to the digital world. There is evidence that unimaginative technological compulsions are forcing various National Libraries in the world to correct their egregious policies of using digital technology for long-term preservation of precious written heritage.

Digital literary imaging

People read books to gain knowledge that might be applied to their own life in the near future. Now there is a different viewpoint in paper that we have e-readers. Digital Imaging of literary works has become one of the most important components for the library’s current strategic plan. Digital imaging has dramatically increased access for readers, scientists, researchers, general public and significant information is available through CD, DVD and Internet. Every digitization project is different depending on the library infrastructure, technological developments and parameters, staff expertise, fund and documents selected for digitization. Various libraries and Information centers have adopted digital imaging of their precious collection of library documents for preservation. Library of Congress in USA with its American Memory Project has digitized more than twenty four million documentary records of Americana. Google’s founders Sergey Brian and Larry Page planned to build up world’s first global virtual library.

World Digital Library

Library of Congress with other major leading National Libraries of the world formed World Digital Library operated by UNESCO and the U S Library of Congress. According to James Billington, Librarian of the Library of Congress, it’s a mission to create documentary record of other great cultures of the world and to provide resources including manuscripts, maps, rare books, recordings, films, prints, photographs, drawings and cultural materials for scholars, educators and general readers. Google tied up with some of the world’s best libraries such as Harvard, Stanford, Oxford and New York Public Library to make millions of books from their collections accessible through Internet. Publishers can take advantage of Google’s latest innovation. It has revolutionized world communication with their Google search engines can
quickly find information on any computer in the world. So that a researcher in Assam or for that matter in West Bengal will not be dependent on the National Library for books but can expect to access world's finest libraries in far less time than it now takes to get to the local library.

**Digital Video for teaching and learning**

Digital Video, as cultural documentation, as historical record, as a teaching tool, supports new modalities for teaching and learning. Appreciation for the scholarly value of digital video is high in the academic domain. It gives scholars and researchers new forms for communication. Digital video is at the edge of academic collection building. It appears in online has important consequences of innovative teaching and research. Internet Film Archive has about three thousand titles and provides unrestricted access to these films. Others are Television Archive, American Museum of the Moving Image etc. But Digital video is not a viable preservation medium. Some libraries have established digital collections but when library collections include large repositories of digital video, both the function of the library and nature of scholarship will automatically change. In the coming decades more libraries will perhaps join on this venture of digital imaging entertainment.

**Digital Preservation of intellectual heritage**

Digital technology makes printed materials available to the educators and the general public in such a way earlier generations could only have dreamed about. In this cyber age of universal digital revolution major libraries are ready to use the amazing potential of digital technology and investing large amount of money on ambitious digital conversion project to make their precious collection more accessible and too often, believing that they are accomplishing preservation goals at the same time. Digitization has unlimited possibilities loosely referred to as preservation. The persistence of long-term digital information preservation remains an essential challenge to library consortium of national importance. While many countries have put in place notable initiatives or strategies regarding digital preservation of cultural heritage, specific attention to long term preservation of printed heritage needs to be further developed since digitization has unlimited possibilities but loosely referred to as preservation. The strength of digital realm is in the matter of delivery, distribution and access rather than conservation whereas good microfilm could last more than five hundred years. Both microfilm and digitization are equally important and complimentary to each other. Together they can provide viable and more accessible long-term preservation of cultural heritage for posterity.

**Technological and other limitations of Digital Preservation:**

1. Technological obsolescence
2. Legal acceptance of digital image
3. Digital migration of stored information
4. Technical Up-gradation
5. Financial Implication
6. Loss of detail in digital images
7. Cyber Security for digital images
8. Technical expertise of digital image conversion
9. Expensive in digital image transfer
10. Temperature and Humidity fluctuation.
12. Stray magnetic fields
13. Material decay
14. Risk in digital preservation
15. E-Surveillance
16. Plagiarism
17. Light effect
18. Many other known and unknown factors

**Digital piracy and Counterfeiting of tangible intellectual property**

In this cyber age world has turned into a global village. Digital piracy and **counterfeiting of tangible intellectual** works has spread rapidly throughout the globe. In this era of globalization, electronic *piracy of tangible intellectual property* is a menace that kills the publication industry and others both commercially as well as creatively. This is a global phenomena and the Indian market is no exception. Internet Hackers can easily enter into the cyber world through Internet and they could acquire important secret documents, bank transactions, business oriented data of any country. Existing Firewall system for the protection of Information Security could not prevent this high-tech crime. Earlier Internet Hackers could be identified from their IP (Internet Protocol) address; recently they are using fake IP.

India is now a major center for the creation of pirated software, confiscated CDs, DVDs or DCVD writers, copy films, music icons, logos, brands, images, fantasy etc. Consumers cannot afford the prices which original works command. The manufacturers of pirated merchandise or fake branded trade related works are working under the shadow or meretricious culture of mendacity and fraud.

Many opine that there is a need to create more awareness in the judicial system against piracy and about the seriousness of crime. Under the Copyright Act, digital piracy of literary and pictorial works is registered as criminal offence. Copyright law exists to protect literary, pictorial works or creative expressions of author's originality. But piracy is treated as a minor offence while judicial leniency is seen as major reason for the rise of this crime.

**Protection of Intellectual Property and creative work**

For the protection of Intellectual Property Rights there is a need for re-orientation, all nations should work together to fend off digital piracy of the stored information. Governments throughout the globe are being compelled to amend laws for the protection of Intellectual Property.

Government departments and transitional companies enunciate grave warnings to the effects of piracy, theft and infringement of the ownership of intellectual property includes text images, logos, acronyms etc. For the protection of Intellectual Property Rights there is a need for re-orientation. Symposiums and workshops should be organized to make them understand the gravity of the crime.

**NASSCOM** set up cyber crime cells in major IT centers in Bangalore, Mumbai, Kolkata, Chennai, Delhi and Hyderabad to restrict cyber crimes and to provide a secure working
environment. The cells help to process, collect and analyze data to prevent high-tech crime. NASSCOM helps to set up Ethical Hackers Club to help companies to identify and address areas of security breach in the network.

**Digit-Micro Photo Remedies for preserving printed heritage**

For archiving library materials subjected to long-term retention periods, microfilm is the only sensible medium to be chosen - despite the tremendous development of digital storage media. Currently there is no digital storage medium available that could reach the durability of microfilm. Digitization makes the knowledge extraordinarily accessible.

Microfilm technology combining with the electronics of computers is providing major new tools for information science and proper conservation treatment of library documents for the benefit of future generation. Computer output microfilming plays the most important role in the preservation of printed materials in this digital age of modern library activities and of transmitting them for posterity.

**Hybrid Technology**

Most versatile Hybrid Microfilm Camera performs both digital and analog capture in one process storing of printed heritages (information) as digital data for instant access and microfilmed images for conservation of library materials.

**Digitization of microfilms (analog to digital)**

Microfilm as an analog and proven age-resistant storage medium could be scanned and digitized to produce necessary back up files for dissemination of information. **High Speed Microfilm Scanner** is effective to disseminate and modernize the Microfilm Preservation.

**Computer Output Microfilm (COM) process**

COM (digital to analogue) for preservation of scanned information on a special type of microfilm converts scanned and stored data directly into microfilm as images for preservation. **Document Archive Writer** replaces all aberrations in the dissemination of information and conservation of library documents through microforms.

**Microfilming of printed heritage**

Microfilming is a well established technology with rigorous international standards ensures the longevity of imperiled knowledge. For archiving library materials subjected to long-term retention periods, microfilm is the only sensible medium to be chosen - despite the tremendous development of digital storage media.

**Digital rights for intellectual property**

Digital rights management is going through changes, in the legislature and also to the eye of law. Attorney Stephen Fishman stated in his“The Copyright Handbook,” that nothing is in the public domain until at least 75 years from 1st date of the publication and 50 years after an author's death for material published in USA and 100 years if published elsewhere. Copyright law protects the creative works unequivocally and recognizes the owner and grants him all the rights, benefits and privileges that come with ownership.

**Digimarc in creative literary works**

Digimarc is an optional service that crawl the web, looking for illegally used images, and then reports back. Cut and Paste is a fairly common Indian practice among the library users.
Generally scholars do not want to get into the hassles of copyright violations or piracy of literary works. To protect creative literary works from unauthorized use, there are options. Products are available that create digital watermarks, visible or invisible, that are applied to each image. The most notable of these is Digimarc.

**Biometric as preventive measure of cyber crimes**

Cyber Law has recognized the digital signatures as authentication of electronic records. Biometric technology is used for authenticating any electronic records to ensure cyber security. According to Cyber Law any person may authenticate an electronic record of his own by affixing his digital signature. The electronic record can be verified by the use of public key of the subscriber. Biometric technology is an automated method to identify or authenticate the identity of any living person based on his physical or behavioral characteristic, such as facial recognition, iris scans, finger prints, voice or geometry of the hands through photographic records.

**Cyber Biometrics as safest technology in security system in the digital age**

Cyber Biometrics has been recognized in this digital age as the safest technology. Biometric analysis combined with conventional methods of identification and verification, like that of ATM card of bank and a PIN code can make the cyber security methods more reliable. Major airports in USA follow this system. Biometrics plays an important role in inmate-visitor tracking in the prisons in UK. In France client-employee access in banking areas are controlled by biometric security system. The demerits of this biometric security system are vulnerable to identity information theft. Facial recognition invades a user's privacy and theft of a subscriber's fingerprints may create problem.

**Conclusion**

Globalization certainly plays a big role in the proliferation of cyber-crimes. Advanced and developed countries have not been able to protect it successfully till today's digital age. It is illusive to eliminate digital piracy laundering across the world within the framework of globalization due to rapid advancement of digital technology.

Creative works and all sorts of photographic skills are based on synthesis of ideas and inherent knowledge. It is difficult as well as tiresome to ascertain originality and authenticity if the ideas are borrowed from different sources and synthesize them and passing them off as one's own. Because in globalised world ideas and information flow freely and easily accessible through Internet.

The only safeguard is the human spirit and moral integrity antiquated concept in this modern age.

Building Knowledge Management System: The Key to Special Libraries Renaissance at the Digital Era

B. R. Mandal, A K Podder and B C Choudhuri
S&T Knowledge Resource Centre
CSIR-Central Glass and Ceramic Research Institute
Jadavpur, Kolkata 700032
E-mail: brmandal@cgcri.res.in

Abstract: Due to exponential growth in Information and Communication Technology (ICT), more and more information is available to scholars today, more quickly than ever before. When users are retrieving information at their desk from the networks and at their mouse clicks, special libraries are fast becoming irrelevant much more than other libraries. The new age of the fourth paradigm of research, the data-intensive knowledge discovery, is making a network full of accessible, inter-linkable, and computable digital resources a web-scale knowledge laboratory. The development of digital technology and its applications in library and information centers, the concept of library management has been changed to information management and again in the 21st century, the entire scenario of information management has started its change to knowledge management. The challenges face special libraries that need nothing short of a paradigm shift of information services and an organizational transformation. This paper is an attempt to discuss the challenges for special libraries, importance of knowledge management and the role of library-information professionals, their possible contributions, vital competencies and skills unique to the 21st century if they want to survive in the digital era.

Key words: Digital technology, Information management, ICT, Knowledge management, Information professional, OPAC, Special libraries, library-information centers.

Introduction

Historically a library was a building on campus housing books and journals and eventually a reading room and an organization that provided access to the books and journals via, various types of catalogues, some based on classification of the library materials. Now the library's status is no longer defined by the collection with mere services, it is extended to include online and unlimited access to global knowledge. Information is a part of library activities, therefore the right information at the right time as a consequence the fourth law of Library Science: 'Save the time of the reader' has long since been an important challenge to the information professionals.

In fact, the concept of knowledge management was coined in early 1990s and the importance of knowledge was first recognized by the business world in the 'global economy' of the 'knowledge age'. Progressively, knowledge management has been an important issue relevant to all disciplines at all levels, including the business, service, Govt. agencies, R & D departments, universities as well as library and information centers. The information management has long been regarded as the domain of the library and information services. Information professionals have already been providing these services by managing collections of internal resources, maintaining the archival records, retaining useful information or development of networks or consortia. But the capability to identifying both formal and informal sources of knowledge embedded in the organization, acquiring,
organizing, preserving and disseminating this knowledge to the stakeholders for specific purpose to improve the performance of the organization. Popularly known as ‘knowledge management’ has been recognized as an excellent skill of the information professionals. In the present scenario, the skill of knowledge management is very much essential to the information professionals as they seek to sustain their critical positions and contribute to organizational performance.

**Challenges for special libraries**

The major source of challenges for the special libraries stems from the development of digital technology and the rapid uptake of this technology in society and particularly in the research and education system. This development has had and will have direct influence such as through the phenomena of the virtual journal, the e-book, the massive amounts of data in digital form and the general availability of enormous amounts of searchable information on the internet via engines. The development will have also indirect influence because digital technology and its various spin-offs also have enormous influence on the way research is done, the way education is delivered, and the way large segments of people are working. Virtual books and journals and other forms of information using the variety of media available (such as sound and pictures and mixes) can be accessed from everywhere and they can be “housed” nearly everywhere where there is server.

The challenges in relation to the development of digital technology and emerging users needs can thus be seen as:

- The changing nature of the traditional functions of the library when research is published mainly in digital form;
- The addition of new functions in relation to the digital development in research and teaching outside;
- The changing identity of the library in relation to archival point of view;
- The diffusion of functions away from the library to other organizations or entities as research groups, universities, public or private departments.

**Knowledge**

Many people can still become confused between the terms ‘data’, ‘information’ and ‘knowledge’. Before proceeding into details, it would be appropriate to define these terms.

There is a disagreement over a comprehensive definition of the term ‘Knowledge’. It is very easy to find patterns in data to perceive information, and information that can be used to enhance knowledge, but is very difficult to define ‘Knowledge’.

**Data** is basically simple, discrete, facts and figures collected as a result of observation, experimentation, measurement or survey, but once the collection of this data are arranged, charted, annotated, or organized in a meaningful way, then data becomes information. Information is a data that has been organized and communicated. Information is visible, independent from action and decision, different in format after processing, independent from existing environment, easily transferrable and duplicate. Knowledge is visible, closely related to action and decision, different in thought after processing, identified with existing environment, transferrable through learning and not duplicate. **Knowledge** is an intellectual capital when people out of creation, add value to information. It is generated, it may be classified and modified, may be indexing and it is shared. Sharing of knowledge is a core element of knowledge management. Digital technology has provided with number of possible solutions for sharing via e-mail, intranet, etc.
Knowledge is classified into three types: (1) **Explicit knowledge**: It is the knowledge of rationality, i.e., policies, rules, specifications and formula. It is also known as declarative knowledge. (2) **Tacit knowledge**: It is complex form of knowledge. It has two dimensions technical and cognitive. It is personal knowledge, which is in human mind and difficult to formalize or articulate and also difficult to communicate and (3) **Background or Cultural knowledge**: This is knowledge that is part of the organizational culture and is communicated through oral and verbal texts such as metaphors, visions, and mission statements. It is useful to form the framework among organizational members, recognize the new information and evaluate alternative interpretations and actions.

**Knowledge management in library-information centers**

Knowledge management is an area which has long currency and relevance to library and information sector. Particularly with special libraries, the ability to identify both formal and informal sources of knowledge within the organization has always been recognized as a valuable skill. The librarians and information professionals have already been providing these services by managing collections of in-house resources or sharing of resources through networks/consortia.

Information explosion and digital technology are the main force behind the origin of knowledge management. Typically, every organization generates large amounts of data and information. Without effective management, it is difficult to identify, locate the information required in a specific situation. As the next step knowledge management came as a strategy to develop organizational knowledge and capacity to derive relevant knowledge from information. That is why knowledge is portrayed as the transformation of information: information is a building block of knowledge which is the refined, relevant and actionable output of information.

Knowledge management can be defined as the management of corporate knowledge that can improve a range of organizational performance characteristics by enabling an expertise to be more 'intelligent acting'. It is a process that helps an organization to find, select, organize, disseminate and transfer important information and expertise necessary to achieve organizational goals.

The different aspects of the functions of the library and information centre can be seen as providing potential scenarios with relation to knowledge management. Some of the most important are:

The library as a learning centre focusing on the provision of knowledge management in all of the key areas of information services. To cope with the exponential growth in human knowledge, libraries need to develop their resources, access and sharing strategies from printed to electronic and digital resources. Libraries should be developed and maintained an integrated online public access catalogue (OPAC) with both internal and external resources as well as printed and other formats of knowledge. The information professional can be like an educator working closely with researchers and having an identity as a generic knowledge professional.

The library as a knowledge centre being co-creator in the production of knowledge closely connected to active research groups. There must be a heightened understanding of the changing end-users (research groups) base and meeting the users’ increasingly diverse needs; e.g., what are the (future) information needs of researchers and what will they need to undertake their research? What should the researchers expect? With the development of digital technology, library/information center also developed as a mediator in the processes of knowledge creation and knowledge use. The library was a place for knowledge
representation through classification for dissemination and for archiving. Indirect usage is also important when a function is performed, which is based essentially on knowledge and information provided through the available services of a library or information centre. In relation to its researchers, the information centre is thus both an infrastructure and a partner a co-creator in the process of knowledge generation.

The library as a meta-knowledge centre working as a catalyst for knowledge synthesis, the organization, evaluation and consolidation of knowledge. Universities and R&D organizations are knowledge reservoirs. These highly valued intellectual assets, regardless of whether they are explicit or tacit knowledge, should be inventoried at library level with the help of advanced technology, archived, indexed, frequently updated and made accessible in digital form.

**Information professionals in knowledge management**

In the context of this paper, 'information professional' refers particularly to “librarians of any special library” with all the necessary skills and competencies.

There are ample opportunities to information professionals to become strategic partners in the knowledge processes within their own organizations. It is true that knowledge management is “a vehicle for enhancing the professional image and role of the information professional”. Information professionals have begun to realize that they have a critical role to play in initiating knowledge management and its success in their organization and their attitude must be in tune with the needs of this new order.

Therefore, information professionals can contribute to knowledge management in the following ways:

- Empowering knowledge workers
- Bridging the gap between the skills acquired and specific jobs
- Leading in ethical and legal issues
- Leading in information management skills
- Innovative teaching for greater collaboration and closer interaction
- Creating knowledge management awareness
- Recognition of and contribution to maximizing the potential of organizational knowledge

Knowledge management is an approach based on the central role of knowledge in organization, with the objectives being to manage and support knowledge work and to maximize the added value of knowledge for the organization. It presents a major shift in focus regarding the development and use of knowledge and information in increasing the effectiveness of organization.

**Emerging roles of information professionals**

It is really a challenging environment to information professional to engage with the tasks that have not generally been regarded earlier, either by themselves or by those for whom they work. Information professionals must be equipped with a wide range of personal and transferable skills and competencies, beyond those traditionally practiced and understood, thus requiring increased intellectual flexibility. Information professionals now need to be equipped with the following new roles:

- Technology experts both in operation and training;
Knowledge mappers mapping tacit and explicit knowledge to enable its classification, dissemination and identifying the gaps in the knowledge;

Knowledge gatekeeper carefully analyze the needs of users and seek to develop cooperative acquisition plans to meet the needs of users;

Knowledge educators working closely with active research groups and help the newcomers to learn as a generic knowledge professional;

Knowledge editors repackaging knowledge into the most appropriate formats and accessible to the users in a reliable fashion;

Knowledge and information disseminators rather than custodians of information;

Researchers both for personal and professional development and for active assistance to the stakeholders of the organization;

Web designers highly valued intellectual assets, regardless of whether they are explicit or tacit, should be inventoried, archived, indexed and displayed and share knowledge;

Metadata specialist working as a catalyst for knowledge synthesis, the organization, evaluation and consolidation of knowledge

Vital competencies and skills

Personal competencies are a set of attitudes, skills and values that enable information professional to take on these new roles effectively and contribute to and enhance organizational performance, image, visibility and competitive urge. Some of the most important are:

- Good communication and interpersonal skill; need to be polite, friendly and give complete attention to the users;
- Expertise in knowledge management
- Understanding flexible needs of users and developing creative solutions;
- Expertise in information management and high level of support for teams engaged in innovation pursuits;
- Creativity and long term vision;
- General management skills library management, financial management, strategic planning, liaison, etc.;
- Negotiation skills for dealing with publishers/licensors/suppliers;
- Analytical and lateral thinking ability;
- Human resource management skills;
- Project monitoring, evaluation and management skills;
- Intellectual property management skills;
- Expertise in ethical and legal issues;
- Instruments and equipment management and maintenance ability;
- General infrastructure management and maintenance skills.

Conclusion

The libraries and information professionals will no longer bounded by resources and systems but diffusing into users' knowledge processes in a digital, network and
computational way. The major characteristics of knowledge management are: a holistic approach, its action-oriented, ongoing process, ever-changing, users-oriented, emphases on organization performance improvement and value-adding and visionary perspectives. Therefore, information professionals need to focus on their users' knowledge and remain updated in their professional knowledge in order to provide value adding services to their users, anywhere and anytime and in desired formats. They need to manage all types of organizational knowledge to maximize its utilization and align it to the provision of information services.

Acknowledgement

The authors are grateful to Prof. Indranil Manna, Director, CSIR-CGCRI, Kolkata for his kind support and permission to present this paper in National Seminar on ‘Challenges in Library Management System’ (CLMS 2012) organized by the Indian Association for the Cultivation of Science (IACS), Kolkata.

Abstract: Weeding out is an appropriate way to build an active, vital, useful & relevant collection development of a library or resource centre. “Every book has its reader” the fourth law of Library Science by Dr. S R Ranganathan tells that each book will have a specific reader at a given time. Hence, weeding out or discarding an entity from a collection is not advisable. There should be a depth analysis and close examination about the processes involved. “Library is a growing organism”, the fifth law of Library Science devised by Dr. S R Ranganathan indicate that library, the storeroom of knowledge should grow endlessly. The main objective of a Library or the knowledge centre (to satisfy its users or patrons) will be achieved when it could cater 100% needs of its users. This is possible only by an active and rich collection (print or digital) development of relevant items. This paper tries to depict the weeding out process adopted at CSIR-NAL and the continuous digital archiving of documents to make the collection live, active and current and in turn solve the eternal problem of space constraint as well as to satisfy targeted end user.

Introduction:

Library or the information centre in an R & D organization is an important part of the scientific community. Library's services are dependant to the specific collection in different forms and formats of that particular organization. Library's collection and its continuous development and maintenance are directed by the organization's mission and objectives. Weeding out is a basic part of collection development process in a resource centre or library. An extensive weeding out will enhance the value of the useful and core collection. Hence, proper professional judgment is necessary to do the weeding out process leading to a proper planning process. To have a balanced, up to date, relevant collection for its user community, weeding out is necessary.

Why Weeding?

Weeding is a part of the complete collection development. By weeding out, the collection automatically becomes vital, active and current and easy to use. Keeping in mind the Ranganathan’s Five Law of Library Science, the diagram below explains very explicitly the key library services of an R & D organization. Updating

---

Fig. 1

Collection development cycle

Read reviews and purchase books
Weed & archive the core collection & discard unwanted books
Shelve and Circulate books
Leaving out a step is unethical
Process and Catalog books
certain aspects of collection development criteria needs to be done in an R & D Library, in the process the earlier criteria are to be discarded and maintaining the perfect balance of retention of the up-to-date and required information and weeding out obsolete and unwanted documents.

The famous model CREW (Continuous Review, Evaluation and Weeding) explains all the above processes to make the library collection current, relevant, easy to access and to lay the path of activities of an institution to achieve the goal/mission in a most appropriate way.

Reasons and benefits of Weeding
1. Useful, appealing and relevant collection
2. Authentic collection
3. Increase circulation and accuracy of retrieval
4. Save the space and time
5. Continuous feedback about collection's strengths and drawbacks
6. Continuous vigilance on unwanted items

When and How much to Weed
According to CREW model, it is apparent that weeding out in libraries should be very systematic and continuous process. On a regular basis, designated staff members should be earmarked to carry out the selection and segregation of the titles from the collection for the purpose of weeding out. Some target should be fixed and members should achieve that. It is an ongoing process. Besides the size and volume of the collection, in an R & D organization like CSIR-NAL (Council of Scientific & Industrial Research National Aerospace Laboratories), it is recommended that the weeding process is carried out every two years.

Another emerging question regarding weeding is “How much / what to weed?” The thumb rule is 3-5% of the collection can be weeded out yearly. Actually the volume of titles to be weeded is subject to the age (initial or matured) of the library or the organization, available shelf space to commensurate with future development plan and obsolescence of regular updates So the turnover period of the collection is about twenty years. The important rule is that librarian’s commitment and judgment are more valuable than the mere numbers to be weeded out.

Selection Criteria
Selection and rejection are both playing a vital role for creating an effective collection development, as both require the same decision making criteria. The precondition of any weeding out process is to evaluate the policy and goal for the collection. Mission of an organization is same but goal to achieve that is changing time to time. The weeding out policy is totally related with the mission and goal of an organization. So each library or resource centre has its own weeding policy. Various factors are to be considered before starting the selection process (R & D Setup):
1. Library's services and users feedback
2. Availability of an item in different forms and formats
3. Availability of alternative sources (Interlibrary loan)
4. Usefulness of the item in future
5. Cooperation with other centers / consortium approach

6. Future research avenues of an Organization (Projects, Products, etc.,)

The approach of the selection process is objective in nature but some sense of professional knowledge is needed to take the final decision based on well accepted acronym “MUSTY”.

- **M**-misleading (factually inaccurate)
- **U**-ugly (beyond repair)
- **S**-superseded (newer edition or better title)
- **T**-trivial (no merit)
- **Y**-your collection has no use (irrelevant)

The specific characteristics of selecting an item to be weeded out in a special R & D laboratory like CSIR-NAL are as follows:

1. Outdated, Obsolete information content
2. Trivial in nature (applicable for a specific point of time)
3. Unauthentic information contents
4. Old editions of the same title
5. Titles available in alternative formats (like in e-formats)
6. Full-text online availability for periodical old issues

Besides these above mentioned criteria, instant demand, anticipated upcoming projects, demand from scientific community, to maintain the richness of the collection to be taken into account for documents to be deselected. Here comes the question “Weed or Keep?”

**Weeding out of Digital content**

With the advent of ICT and digital archiving, the nature of collection development and its regular maintenance has changed a lot. Users are also more used to with digital content because of its characteristic features like instant, current, available on desktop, easy to access and locate and so on. As weeding is a part of collection development so weeding of digital content needs to be focused. General opinion is it is very difficult and daunting task to perform. There is no a specific rule or criteria for discarding those items. Irrespective of the type and uniqueness of a library, space constraint is the main reason behind the weeding of items. In case of digital content, in most of the cases the content is residing on the publisher's site. Library is acting as an intermediary to facilitate the access of the content to the users. In case of digital content “Keeping or Archiving” is more feasible than “Weeding or Discarding or Deleting or stop accessing”. With the advent of modern advanced high capacity storage medium, with compatible software, help to archive huge quantum of E-content. The format of the storage device should be universally compatible and platform independent.

Taking into account the nature of the digital or electronic collection, the weeding out norms followed at CSIR-NAL for electronic items are as follows:

1. Usage / download statistics
2. Nature of accessibility (Paid access or Open access)
3. Type of purchase model (Perpetual or Subscribed)
4. User feedback on a particular E-item
5. Cost aspect
6. Outdated formats

An example at NAL, Ebooks from CUP (Cambridge University Press) and (Credo) Reference collection from were discontinued on usage ground.

Weeding out Policy and Procedure @ CSIR-NAL

NAL, a constituent laboratory of Council of Scientific & Industrial Research (CSIR) has a "Manual of Procedures and Practices for S &T Knowledge Centre" which clearly depicts the Weeding out Policy in CSIR laboratories. As an ISO certified S & T laboratories, its Divisional Quality Manual (DQM) also explains the weeding out policy and procedures followed in the library. The following salient points, mentioned in the manual are as follows:

1. Weeding out at every two years of interval
2. Identify the documents to be weeded out, following the selection criteria by the Library staff
3. Enter these numbers (Accn. Nos in Libsys software as 'To be weeded out'.
4. Generate the list from Libsys with minimum bibliographic details
5. A subcommittee (minimum of four members) will be formed under the leadership of LAC Chairman with the approval of Director, CSIR-NAL
6. The committee members are subject experts and also well aware about the NAL's mission and future plans.
7. Computer generated list will be circulated to members for perusal
8. Committee members should physically verify and review the selected items
9. Receiving the recommendations of the members and obtain the official sanction from Director, NAL for items to be weeded out
10. Update the status of the records in Libsys database and also in the Accession Register as "Written off" items
11. According to CSIR Library Manual, this list of weeded items will be communicated to all other CSIR laboratories if they are interested to have these titles on a first come first serve basis.
12. If no response within a specific time period, these discarded items will be sent to stores for disposal.

Analysis of the Report of two Successive weeding out at CSIR-NAL

Information Centre for Aerospace Science & Technology (ICAST), NAL had completed weeding out procedure for two times, in the year 2008-2009 & 2010-2011.

Report I (2008-09): According to 2008-09 report, total 900 titles of different types of documents had been selected and also weeded out from the entire collection. Keeping in mind the mantra "Keep and not weed", the Selection criteria followed was very rigid (only ephemeral materials like Newsletters, progress reports, directories, yearbooks etc) had been taken for weeding. While the core disciplines were not considered for weeding out.

Report II (2010-11): With the emergence of E-Resources and the facility of online access, the collection development plan at NAL has changed and it had a substantial impact on the weeding out procedure also. With the relaxation in the selection criteria, i.e. including more
conditions for weeding, the number has gone up to around 2000 book titles from 84000 of its total collection. This process is partially completed and the interim report has been produced. Remaining part of the process will be completed in near future and final report will be published after that.

Fig. 2

The findings are as follows:
1. Number of items weeded out in 2010-11 is just double that of 2008-09.
2. More items are in the following subject areas like Computer Science and Electronics
3. As the scope and coverage with respect to different subject collection and different type of items other than the purchased ones, Gift/Free, Exchange were indentified in the weeding out process, obviously it resulted a positive number of items to be weeded out.
4. Ebooks from CUP and CREDO were discontinued based on the usage statistics
5. Collection is getting matured and active in near future

Future Plan and Strategies

With the change in forms and formats of the content and the type and pattern of accessing the information, the ethics of weeding has changed. A proper balance should be maintained with the need for an active and useful collection. Librarian should take a proper decision between “How much to weed and how much to keep or archive?” This is very much applicable in a special R & D library like CSIR-NAL. There are plenty of modern sophisticated archiving facilities are available:
1. Compact storage system for printed items
2. Secondary storage facility for less circulated items
3. Digitization of copyright free items. Archival management should take care of the content and also the look and feel of the digital object.
4. Developing the Institutional Digital Archival for all unpublished or grey in house publications like Project Documents, Special publications, etc.
5. Exploring the possibilities to procure more e-contents than print publications
6. With proper cost benefit analysis, it is preferable to get the online perpetual access of the old issues of scientific journals i.e. the archrivals of different publishers and slowly discard the related hard copies of bound volumes.

**Conclusion**

To conclude we quote, “*A Good library collection is like a good haircut. It’s not what you cut - it is what you leave*” by Anne Felix, Texas Public Library System.

**Acknowledgements**

We would like to express our thanks to Director NAL for giving us the opportunity to prepare this case study. We also want to extend our thanks to Mrs. Sudhalakshmi, Coordinator, Weeding out Committee for the valuable guidance for presenting this paper.

Abstract: With the advent of the internet the impact of globalization has been felt in all spheres and more so in library systems. However, this has been offset by emerging challenges and issues unique to the global inequalities and socio-economic structure of the country. This article deals with the pro's and con's of globalization and the challenges it has thrown up in library management systems in University environments particularly germane to India and the USA. Certain challenges faced in library management strategies have been highlighted and have been dealt with under the broad areas of (a) upgrading the capabilities of libraries in tune with changing economic climate (b) developing strategies to achieve maximum output and outreach (c) reform library management education (d) involve library management personnel in University education systems (e) introduction of safety checks using an honor code system within the ambit of library management. An account of the state of the University libraries in both countries and problems associated with global inequalities has also been dealt with in the above context.

Key Words: Library Management, Globalization, Universities, Honor code system

Introduction

In the present world, knowledge dominates the society in all spheres of activity as well as in everyday lives. Thus, a knowledge-driven economy has been defined as the rapid development and convergence of communications, computing and digital content to enable the globalization of production and stimulating enterprise and creativity. In the context of Libraries as repositories of knowledge: “Libraries of all sizes and types are embracing digital collections, although most libraries will continue to offer both print and digital collections for many years to come” (Tenopir, 2003). In the 21st Century, it is not just knowledge, but more importantly the effective use and exploitation of all types of knowledge to fulfill the business and economic activities of developing economies that is crucial. In the educational sector, the library management and services have increasingly applied and utilized the electronic information resources to complement the conventional materials. Librarians have played key roles in the collecting, storing, organizing and disseminating of knowledge to society. Although the advent of Internet has brought predictions of the demise of the traditional role of libraries, it has proven that libraries are, not only crucial but the librarians’ role as knowledge providers has become even more significant. In universities, for example the head librarians continue to become an important partner in decision-makings while administrators, professors and students see the library as the nerve-center of the campus. Libraries have indeed changed radically from their custodian role and emerged as dynamic partners in knowledge management programs.
The Librarians' growing interest in knowledge management has led to a number of issues regarding the difference between “information” and “knowledge”; and between “information management” and “knowledge management.” As such, Library and information professionals have shown a great interest in knowledge management (KM) as it is regarded to have considerable similarity on the concept of coding, storing and transmitting knowledge, as the primary focus of libraries (Townley, 2001). For many, KM is perceived as a re-branding of librarianship or information management. KM is not regarded as a new phenomenon as librarians have always operated as intermediaries between people who have knowledge and those who need to know. Bender's (1999), reiterated that knowledge-dependent organizations would be wise to integrate their own libraries into their knowledge management program. Davenport et al (1998) categorized KM into four broad types of perspectives, namely (a) to create knowledge repositories, (b) improve knowledge access and transfer, (c) enhance the knowledge environment and manage knowledge as an asset and (d) to recognize the value of knowledge to an organization.

**Upgrading capabilities of libraries**

In both India and the US, with the rapid development of information and communication technologies (ICTs) have created the knowledge society, which will impact upon developing economies (India) as well as on developed nations (USA). As such, Librarians in both these nations have an important role to play in overcoming the digital divide, and making reference and sharing global knowledge. Information and knowledge are expanding in quantity and accessibility. In many fields future decision-makers will be presented with unprecedented new tools for development. In such fields as agriculture, health, education, human resources and environmental management, or transport and business development, the consequences could be revolutionary. Communication and information technology has enormous potential, especially for developing countries such as India and in furthering sustainable development. In terms of collection development, libraries have begun to reduce the traditional materials and have instead increased the purchase of network services and digital resources (Bertrot et al., 2004).

Network-based services and resources offered by libraries today, including digital references, digital collections, online databases, e-journals, and e-books, enable libraries to operate anywhere, allowing patrons with internet access to access content, services, and resources any time (Bertrot et al., 2004). Librarians and information personnel (IPs) need to realign their service in line with the knowledge demand of the users in the workplace. Users require repackaged or analyzed information that is needed for productive use. KM is recognized as a key factor in organizational success in both profit and not-for-profit organizations. It would be interesting to see the potential benefits in its application within libraries, and their relationship with...
the parent organizations and with the communities they serve. Librarians and IPs are trained to be experts in information searching, selecting, acquiring, organizing, preserving, repackaging, disseminating, and serving. However, professionals in information technology and systems have also regarded information management as their domain because of the recent advances in ICT and systems. The freely accessible information on the web, in conjunction with the escalating costs of library materials, threatens the traditional mission of libraries to create and sustain large, self-sufficient collections for their patrons (Troll, 2002). Libraries need to reposition or enhance themselves to act as KM centres for small businesses, providing both KM and competitive intelligence (CI) services. An increasing number of corporate and University libraries in the US are managing their knowledge by archiving information in document form, maintaining databases and data warehouses of corporate knowledge, and mapping human knowledge within the organization. Recording the tacit knowledge and converting it into explicit knowledge becomes a new challenge for librarians involved with KM. While in the Universities in the US, the advancement of library management practices have kept pace with the explosion of knowledge with advent of the internet, this has not happened to a similar extent in the Indian Universities. Some of the privileged Universities / Institutions of Higher learning who function directly under the University Grants Commission or the Department of Science and Technology have benefited, whereas the rest have sadly languished. It is not that internet access has not reached these Universities, it is just that they have not upgraded their Library Management Systems to keep pace with the times.

**Developing strategies to achieve maximum output and outreach**

As a learning organization, libraries should provide a strong leadership in KM which involves both managing tacit and explicit knowledge. The library's challenge in managing and digitizing the knowledge can be undertaken by providing a repository of all of those knowledge resources, both internal and external. The Libraries' new role as a learning and knowledge centre as well as the knowledge commons for their specific users is a reality. It is a centre for learning and intellectual discourse and facilitates knowledge creation. Unlike those business organizations whose goal for knowledge management is for competitive advantage, most public, academic, and institutions of higher learning have a different agenda: to disseminate knowledge and make it available for the end users. To achieve this, the strategy should be to effectively reach out to the clientele and use all manner of technologies to achieve this goal. A library cannot be treated as a centre that is open 9 to 5, it should be accessible at all hours.
and this is precisely what occurs in Universities in the US. Libraries are open practically 24 h a day! In the Indian Universities on the other hand, librarianship is still looked upon as a 9-5 job and the library shuts down when the 8 hr work schedule is done. Another important method which has been adopted by Universities in the US is to have mobile compliant library access. Thus, for the tech-savvy students, this is an easy manner of accessing the library.

**Reform library management education**

All University libraries both in the US and in India can participate in enhancing their knowledge management functions in some critical areas and services, such as, knowledge resources management; resources sharing and networking; information technology development; user services; and human resources management (tacit knowledge). Librarians need to move forward in line with the new shifts toward knowledge management, if they do not want to become obsolete. Knowledge management helps libraries to survive in their competitions. Librarians can contribute in their traditional ways, such as by providing access, working in partnership, structuring knowledge, imparting skills, preserving heritage, and inspiring trust. With changing times, the library management education too should change and only this would empower libraries to serve as nodal centers of information and knowledge.

**Library management personnel in University education**

The trend of involving library management personnel in the University education system is catching on and is prevalent in the US Universities. A librarian or a library personnel is no longer separate from the educational system, rather they are now an integral part of the system. A good library manager, via people-centered management, leads the
direction of the organization, identifies new projects and creates new teams, task-forces, and committees to work on these projects, introduces new technologies, programs, and services, and directs applications for grants. Thus, librarians and library personnel are part of the educational system of the Universities rather than being isolated and functioning on their own. Unfortunately, the Indian University system has yet to adopt this culture of active involvement of library personnel in their educational endeavor. Perhaps, workshops such as this one would be a step in the right direction.

Introduction of the honor code system by Libraries in University education

With the advent of the Internet and the consequent globalization, plagiarism has become a rampant issue both among the academics and the students. The problem has become so pernicious in University environments that a recent article in the journal Nature (vol. 481, January 2012, Page 21) featured how it has affected academia and what can be done to stop it. In our opinion, introduction of an Honor code system by Libraries (as being adopted by most US Universities) would be the first step in combating this bane of plagiarism.

Conclusion

In conclusion, libraries in academic setting in both the US and in India have had a long and rich experience in the management of information. For any library to succeed in implementing knowledge management, it will require a strong leadership and vision from the top administration, which can influence the University’s knowledge sharing efforts in a positive way. Hence, librarians should work together with ICT professionals and others in the Universities to develop the appropriate knowledge management systems.

Knowledge Resource Centre in 2020: a case study in Respect of CGCRI Library

Chandana Patra
Knowledge Resource Centre, CSIR-CGCRI, Kolkata
E-mail: cpatra@cgcri.res.in

Abstract: This paper outlines the activities of the CSIR-CGCRI library for the fifty years period from its inception. Discusses the changes faced in its activities. The case of changes and evolution of the CGCRI library is an indicator that narrates the activities of the R&D libraries in India. Finally, it has made an attempt to give a direction to the R&D libraries in India from the experience gained studying changes and activities of the CSIR-CGCRI library.

Keywords: Case studies, Knowledge Resource Centers, CSIR-CGCRI libraries, Trends of library services

Introduction

A good number of R&D institutions were established in India soon after independence of India to make India self reliant. As a result, R&D libraries were established along with the respective R&D institution to cater the information needs of the researchers of the institutions. All these libraries are housed in a good ambience with sound collection of their respective domains. Now, various issues are coming up for discussion. It is asked whether these libraries and the professionals are competent to carry out the activities to fulfill the objectives of the set up for which these are meant for. It is true libraries and the ambience of the libraries, services of the libraries have been changing and the issue needs attention. Here is discussion what did we see last 50 years in CSIR-CGCRI library in respect their work and services.

Fifty years: Glimpses of the activities of the CGCRI library

In 1950's, the library, an integral part of the R&D activities of the Institute started functioning and evolving with the requirement of the Institute. In 1950, mostly the activities were confined procurement of documents, cataloguing, circulation, etc. In early stage, after formal opening of the building in the evening of August 26, 1950, library was housed in a hall adjacent to Director's cell. By the end of the 1950s, the collection size went more than 8100. In 1960's, with a view to provide a medium for rapid dissemination of information to scientist and technologists on the important contents of world literature on glass, ceramics, enamels, refractories, mica, etc., the Institute library started bringing out a monthly publication of classified titles under the title “CGCRI Documentation List.” The first number of the bulletin for the month June 1966 listing 268 titles brought out. The publication enumerates references scanned from the current scientific literature received at the Institute. The entries were arranged subject wise according to Documentation Europeenne Ceramique system of classification. By the end of the 1960's, the collection size, total number of books including bound volumes reached to 25243. The number of scientific and technical journal subscriptions including those received against membership of learned societies was one...
hundred forty nine. A quite good no of journals were also received in the library on exchange basis against CGCRI Bulletin.

In 1970's, the activities of the library and information processing work of the Institute were carried out in three different sections, namely Library, Documentation and Data Bank. In order to cope with the progressive increase in an annex having floor area 61 ft X 25 ft was constructed and the entire library was reorganized for effecting overall improvement in storage and preservation of documents to ensure quick retrieval. Amenities in the reading room were also increased. Development activities in information retrieval techniques were also continued and a model thesaurus was developed on glass fibre technology for deep subject indexing with controlled vocabulary for the bibliography on glass fibre technology.

Another important work done was receipt and technical processing of scientific publications offered by the Ministry of Overseas Development, U.K., through the British Council, Calcutta. Information was catered to the researchers through supply of reference materials on various research and industry matters. Selective short bibliographies were prepared and supplied on request from the scientists. The work of processing and publication of subject bibliographies were continued. Evaluation of a system for collection, organization, storage and retrieval of scientific and technical and techno-economic data were undertaken. Apart from the existing data-base (CII) of the Documentation data, compilation work on raw materials, process, production, capacity, quality, control, demand, costs, factory layout, plants, manpower, exports, imports, and other techno-economic data in the field of glass and ceramic was taken up. By the end of the 1970s, the collection size, total number of books including bound volumes reached to 31,235. The number of scientific and technical journals received on subscription and membership basis 139, on exchange basis 124 and on complimentary basis 75 respectively. In 1980's, The library continued to render infrastructural information facilities to the R&D personnel of the Institute as well as to those from the glass and ceramic industries, universities, and other research organizations. For the purpose of wider dissemination of information Documentation Unit of the Institute made available subject references and information relevant to the different R&D projects to the project leaders and scientist subject references and information relevant to the Institute. Data Bank also continued to cater to the various work of compilation work of techno-economic, industrial and commercial data/information needs of the R&D personnel of the Institute as well as of the related industries, consultancy organizations. An organization of the National Information Centre for Advanced Ceramics (NICAC) under aegis of the National Information System for Science and Technology (NISSAT), Govt. of India, was set up. To meet the consistent demands from the industries, business houses, etc. in India and abroad, “Directory on ceramic and glass industries in India" a National directory” was compiled by the Documentation Unit. The same was published by Vilmy Ricerche, Italy for international circulation. The end of the 1980's saw the Computerization of Documentation Services. In order to cope with the increasing volume of the existing conventional bibliographic data base as well as for quick current awareness, and bibliographic services, steps started to computerize the information storage and retrieval system. To implement the first phase of the plan for the computerization of the Documentation services input of bibliographical references selected from the relevant literature was given to the computer. In an effort to create a comprehensive bibliographical data base in the relevant fields, the computer was also fed with a portion of the retrospective bibliographical references from the manual database of the section. A detailed program for development of a microform library unit was prepared and included within the purview of overall “Informatics” programme of the seventh and eight five-year plans of the Institute. The Library also included in the computer networking of scientific and technical libraries (LIBNET)
programme sponsored by NISSAT, Government of India, New Delhi. By the end of the 1980's, the collection size, total number of books and publications including bound volumes of journals, standards, micro documents etc. reached to 35,531. The number of scientific and technical journals received on subscription and membership basis 73, on exchange basis 110 and on complimentary basis 30 respectively.

In 1990's, the Calcutta Library Network (CALIBNET) as envisaged by NISSAT, Government of India, was a Metropolitan Area Network (MAN) for libraries in Calcutta. The CGCRI Library included as one of the 40 S&T libraries of the Calibnet programme which aimed at automating the nodal libraries as well as creating a library service organization for providing global user services. The CGCRI Library expanded services through CALIBNET. The Data Bank continued development, augmentation and updating of techno-economic, industrial and commercial data bases. The two important services of the Documentation and Data Bank were to bring out Documentation list on Glass and Ceramics and CGCRI Data Bank Bulletin for the wider dissemination of glass and ceramic information for the Scientist of the Institute as well as for the related industries, business house and others. However, at the dawn of the 1990s, new trends and developments worldwide pose great challenges for library services in India. This was information and communications technology, which opened new doors in every profession and segment of the society. By the end of the 1990's, there was a great change in information access due to Internet. Library introduced dial up Internet access facility in the library and provided informal training to the users of the library as and when they requested for the same in respect to how to surf net, how to use e-mail facilities, etc.etc., in a word user were acquainted with how to access internet resources and services.

The New Millennium and Changes in the CGCRI library activities

The above discussion outlined the activities of the library from the 1950's to till new millennium. In 2002, to improve the overall efficiency of the library services, it was decided to automate library's key functions such as acquisitions, serials control, cataloging, circulation and the public access catalog. Accordingly, an integrated library software Libsys was installed in 2003 and retrospective data approx for 30,000 documents were feed to the system. In 2005, Library shifted to a new site of the Institute, having floor area of 6800 sq ft merged with the three units, namely, Library, Documentation and Data Bank and named as S Kumar Library. The S Kumar Library again has been recently renamed as CSIR-CGCRI Knowledge Resource Centre as decided in the last Meet of the Head of the Libraries of the CSIR Laboratories.

By the beginning of the new millennium, great achievement of the Library of the Institute was to introduce e-journal services to the users of the library that were free on print subscription. Now, library resources are not only remained confined within four walls of the Institute. The library resources are now consisted of both print and digital document. Due to CSIR-Ejournal Consortium library has now enormous number of journal access of various publishers including patent, standard and citation databases. Managing services of the e-journals are the most important issues. E-journals added enormous resources to the collection and improved the service of the library, enhanced access to journal literature, and decreased the demand for photocopy services as well as document delivery of single articles. Library organized both formal and informal training to the staff as well as library users as and when it was required.

Now let's see the changes occurred in the activities of the library. Some old activities have been disappeared where as some new activities are getting created. The information need of
Emerging Trends including Knowledge Management

the researcher are categorized in three divisions, current approach, day to day need, and exhaustive approach, i.e. literature searching. Libraries adopted mechanism to keep researcher abreast of the recent developments of their respective fields. The library provided Current Awareness services of the contents pages of the subscribed journals, subscribed Current Content services, compiled Documentation list and Data Bank Bulletin to meet the information needs i.e. current approach of the researcher. But, due to the development of the information and communication technologies, internet, these are now gone in the hand of publishers. As a result, library has been compelled to discontinue the compilation work of contents pages of the subscribed journals, compilation work of Documentation list and Data Bank Bulletin and discontinued subscription of the Current Content services. There is reduction in shelving documents, reduction in Xeroxing. Even circulation work, reading room readers are getting less day by day. Users are mostly seen in the internet access zone of the library. Researchers are accessing their required information at the desktop, in their lab itself and in laptop, mobile phone. Time moves ahead and CGCRI library reengineered itself. What are we seeing ultimately? Once we had struggle with the management for the extension of library space, reorganization of library collection, now we are looking for the disposal of print publication, donate to others.

There is change in nomenclature from library to Knowledge Resource Centre. Storage media like microfilm, CD-ROM are obsolete. Regional library networking to provide more resources at the hand of researcher is all issues of the past. Internet has created tremendous opportunity for all. The way we carried research work are changed. Who bother now to consult a printed secondary source to carry out literature survey? Information in respect to keep researchers abreast of recent developments is being provided by the publishers direct to the researcher through mail, RSS feed, etc. More and more resources are being subscribed and procured in digital form and are accessed through internet. The activities in relation to the consortium are taking more importance to extent resource base for the research work and this is the scenario for others too. The case of changes and evolution of the CSIR-CGCRI library is an indicator that narrates the changing activities of the R&D libraries in India.

Further, there are changes world wide in scholarly communication activities and libraries being a part of the scholarly activities are getting affected by this changes. Traditionally, the research result, knowledge was mainly communicated through journals, books, booklets, technical leaflets, technical briefs, posters, videos, radio transmission and get communicated through print media, electronic media, optical media, Internet, etc. Publishers were mainly involved in the publishing activities. But, development in digital technology has given many alternative opportunities to communicate research result to scientific community. Here is the discussion on the issues.

World wide changes in scholarly information dissemination activity

Societies worldwide are in the midst of great change, agrarian society to industrial society, and now information and knowledge based society. Some of the important development of this information and knowledge based society in respect to scholarly communication activities is Open Access, Digital Library and Social Networking Services. Open access is very important debate now for dissemination of research result. Institutional repositories are developed to provide open access to institutional research output by self-archiving. The role of libraries in providing widespread and inclusive access to knowledge is widely acknowledged. Open access initiative is a new paradigm shift for research library. The role of
libraries in providing widespread and inclusive access to knowledge through creation of Institutional repositories is also widely acknowledged. Institutional repository is an online locus for collecting, preserving, and disseminating - in digital form - the intellectual output of an institution, particularly of a research institution.

Digital technology can make the works of man permanently accessible to the billions of people all over the world. A social networking service is an online service, platform, or site that focuses on building and reflecting of social networks or social relations among people, who, for example, share interests and/or activities. The prospect, followed by the reality, of e-journals and e-books, and of cloud computing, together with the rise of repositories, and other sources of open access scholarly materials, have further raised questions as to the future nature and viability of libraries. Question has raised whether the work of librarian as intermediaries between information source and researcher are not required. It is further debating whether the structure of the library within four walls is not required. These have changed the activities of researchers. The way information was generated and consumed all are now in a world of change. In one side the role of R&D libraries in providing widespread and inclusive access to knowledge is widely acknowledged, other side question has raised whether the work of librarian as intermediaries between information source and researcher are not required.

Development of scholarly information dissemination activity in India

The above changes are visible in India too. India has launched many new Open Access journals and converted some reputed subscribed-based journals to Open Access. In India, Institutional repositories are coming up. Some of the initiatives are The Indian Institute of Science, Bangalore; Indian Institute of Management, Kozhikode; Indian Statistical Institute, Bangalore; Indian Institute of Technology, Delhi; National Institute of Technology, Rourkela; National Aerospace Laboratories, Bangalore; National Chemical Laboratory, Pune; National Institute of Oceanography, Goa; and Raman Research Institute, Bangalore, National Metallurgical Laboratory, Jamshedpur, etc. Some of the important digital library initiatives are Cultural Heritage Digital Library in Hindi (CHDLH), Archives of Indian Labour: Integrated Labour History Research Programme, Digital e-Library(Dware Dware Gyan Sampadaa/ Providing Books at Your Doorsteps), Digital Library of India, India Education Digital Library, Kalasampada: Digital Library - Resources of Indian Cultural Heritage (DL-RICH), Muktabodha: Digital Library and Archiving Project, Traditional Knowledge Digital Library, Vidyanidhi, Vigyan Prasar Digital Library. Some of the organization from India has joined to the Universal Digital Library (UDL), an initiative by Carnegie Mellon University to mass digitize human knowledge by capturing all books in digital format and make them freely available over the internet. The Universal Digital Library has a particular focus on digitizing (and storing safely) rare and unique books from around the world. When it says about Social Networking sites, India is not very far behind. There are plenty of social networking sites to choose from. Various professional groups have created their own platform to debate and discuss issues within the professional groups. These are all issues now have impact on library services and the CSIR-CGCRI library is not also exception.

Future for the CSIR-CGCRI library

In today's context, CSIR-CGCRI library has to play two distinct roles - to serve as a local centre of information and knowledge, and be a local gateway to national and global knowledge for the ceramic community. In one side, the CSIR-CGCRI library needs to remain
busy at present to manage changes. Other side, they need to develop the systems which are now coming up throughout the world for information based or knowledge based society.

Since the establishment of the CSIR e-journal consortium service at the end of 2000, the library in CSIR and DST set up in India has made rapid progress in constructing information resource sharing system and offering web-based information services to the patrons of scientific and technical communities all these institutions. It is felt that the importance of the consortium access will be continued until a remarkable change occurs from the open access movement and as a member of the consortium the library has to maintain coordination with the consortium to provide services to its local users. It is importance to bring the information and the user closer together, regardless of the location and the format whether through local procurement or consortium based procurement. Though information are channeled from the publisher to the researcher, there is a still need of a intermediaries to keep track of all available information required for his/her organization, to carry out subscription activities and to bring them in one place so the user of the lab need not be bewildering here and there for their required information at least for the end of the decade i.e. 2020.

The work for the development of open access institutional repository has just started here in CGCRI. But, it is not yet taken active participation from the scientists. The CSIR has made mandate and library professional are vested the responsibility to develop the institutional repository. Presently, we are working in this area. One of the problems we are facing in working for the development of the Institutional repository is lack of controlled vocabulary for the standardization of the terms. Therefore, we should go now for find out obstacles and opportunities to open research result, assist in formulating law and policy to open research result, develop metadata for the repository. Further we need to find out how social networking services can be utilized for the providing information services to our users at local and global level.

Further, In India after advent of independence, technological developments have been taking place in leaps and bounds. India has almost achieved self-reliance in the ceramic needs of the country. It is required to develop a digital repository in ceramics to improve an integrated resource where diverse information sources on the topic on ceramics to be brought together in a single navigable web site. This is needed to bring together the wealth of ceramic information resources of India that is scattered in the different places. The author feels that the library professional can take a great role in this direction.

Conclusion

Once, the strength of the R&D libraries in India was evaluated on the basis of the size of the collection of their respective discipline, availability of funds to subscribe and procure relevant documents for the discipline, building, and reading room amenities. Now, in addition to serve the local users' communities, these R&D libraries need to be part of global community of the respective discipline bringing together the best of their disciplinary output of India of the respective discipline. The R&D librarian's job content is to concentrate on servicing users on specific discipline and it is now not only for local user. As India has almost achieved self-reliance in the most of the disciplines, it is required to develop digital repository in these disciplines bringing together in one place all the works of the respective disciplines in a single navigable web site. Role of library professional is now important for the creation of these repositories in order to develop the respective community-based information system and thus maximize the dissemination of India's best works of the
disciplines and thus make visible to the world community. Further, the main issue is to develop disciplinary repositories needs development of domain specific metadata. The boundary of the discipline so far achieved can be well documented once we could develop the domain specific metadata of the disciplines. It is hoped that by now we R&D libraries shall start work in this direction and can achieve the target by 2020.

Recycled or Recyclable Paper: A Concern for LIS Professionals in Preservation of Paper Based Resources

Suchismita Majumdar
Sir Gurudas Mahavidyalaya, Kolkata-700067
e-mail : suchi_m06@yahoo.com

Abstract : This paper brings to light the complex issues of the totality of the recycled or recyclable paper usage at the publishers' level. A metamorphosis at the pulp and paper industry is a sure concern for the LIS Professionals as emerging trends are posing huge impact on the library management systems in preservation of paper based resources.

Keywords: Preservation, paper, recycled paper, recyclable paper, management.

1. Introduction

We, the LIS professionals, in the dawn of e-era are gearing up to prepare ourselves towards facing a paradigm shift in the library management systems. “Digital” is the buzzword. “Paper or” or “paper and” is the debatable topic. Its true, but as far as the global social scenario is concerned a rapid technological dynamism in the information retrieval systems, make it a necessity to preserve our valuable documents in the paper format. Preservation of documents actually means, keeping the documents in its healthy state of usability for a longer period of time, as far as possible. Composition of paper plays a vital role in prolongation of life of a paper and management of its rate of deterioration or ageing. We must have to have an overview of recycled paper qualities used by the publishers or purchased for publications. The paper we deal with is variedly composed; therefore depend upon the varied needs for preservation. Paper specifications are coming up. We need specific guidelines to combat the problems in prolongation of life of a document. As far as paper is concerned, we, the LIS professionals, globally, have actually entered into a network comprising of sectors such as paper industry, book publishing associations, publishers, book publishing industry, paper advocates, paper buyers, paper and pulp technology, trade associations, printers, legislators, designers, waste paper dealers, distributors, and many more, directly or indirectly. Awareness of the totality comprising of recyclable paper and its related aspects is vital. We the LIS Professionals must set the management perspectives at par with the socio-economic dynamics. We may need to manipulate some professional strategies so as to fit to the innovation at the global platform.

2. The Trend of use of recyclable and environment friendly Paper Quality:

BRITISH COUNCIL LIBRARY and STATE CENTRAL LIBRARY, KOLKATA have been surveyed for data collection.

Resource selected for the survey concerned: BOOKS.
**Data collected during the survey:**

### A. INDICATIONS FOR THE USE OF RECYCLED PAPERS (1980-2006) BY FOREIGN PUBLISHERS.

<table>

**DATA FOR PAPER USED DURING THE TIME PERIOD (1980-2010) BY INDIAN PUBLISHERS.**

<table>
<thead>
<tr>
<th>Sl.No</th>
<th>Name of the Publishers.</th>
<th>Indications as is found at the back(verso) of the Title page of the publication.</th>
</tr>
</thead>
</table>

**3. Data Analysis:**

1. Data analysis reveals an increased use of the above mentioned paper in the time span of 2007 to 2010 as compared to the findings during the time span 1980 to 2006.
2. Same publishers are adopting various types of paper in their publications.
3. The publishers though using environmentally responsible paper, their variations in specifications are evident.
4. Data Analysis for Indian Publishers indicate Penguin Books India Pvt Ltd. has started to give some indications in the year 2009-2010. A special analysis of the trend from 2007-2010 was very important. The INDIAN publishers are very rarely publishing any such information.
5. No other Indian publisher encountered during the survey has started to give any indications for such specifications.
6. Most of the foreign publishers encountered during the survey have given specifications at the back of the title page about the paper they are using in their publications.

**4. Implications of the indications used by the publishers:**

The trend is towards use of recycled or recyclable paper at the publishers' level as is evident from the survey.
For a LIS professional be it a librarian, a conservator or an archivist, it is a sure concern, What is a recyclable or recycled paper? How far it is different from an ordinary content paper? What is the content specification of such paper? What is the product of sustainable forestry programme? What is chlorine free content? ... and many more as we proceed towards the intricacies of the topic. All this is having an impact on the LIS arena as far as management of paper based resources are concerned.

A search for the answers to understand the scenario implied in the indications are as follows:

4.1 Recycled Paper:

Recycled paper is obtained from recovered paper materials that have been de-inked and re-pulped. The recycled content is measured as a percentage of the paper's weight. This percentage of the recycled fibre is the issue for preservation of the document composed of recycled paper. ISO-9706 recommends recycled paper for short term temporary records.(4) Paper as we know is basically cellulose, hemicelluloses fibres to form a homogeneous sheet.

Paper generally has a weight, 40-120g/m2, as is differing from tissue (low weight) and paperboard or board (high weight>200g/m2) and white paper is generally achieved through bleaching, raw material of recycled paper is secondary fibre rather than wood or agricultural residue like fibres from straw, grass etc. paper can be graded in 'n' number of ways in permutations and combinations of constituting recovered paper grades sorted by paper mills to produce different types weight, raw materials, usage, finish, surface treatments, etc.

Recycled paper is a grade of paper basically concerned with pre-consumer waste paper and post-consumer waste paper of paper and boards. The term recycled content paper covers a multitude of grades having different characteristics and qualities.

On the other hand pulping separates the fibres by removing lignin. (1) Lignin is responsible for yellowing of paper. Pulping can be processes in between complete mechanical to complete chemical. Pulp may vary based on raw material where raw material is recycled or secondary fibre de-inked in case of recycled paper. Based on bleaching pulp can be TCF (Total Chlorine Free), ECF (Elemental Chlorine Free) Chlorine Bleaching (Chlorine gas and hypochlorite), Oxygen/Ozone Bleached. Unbleached. Pulp may vary according to yield also. Pulp varies according to fiber length, recycled fibre is shorter and becomes shorter with recycling and differ from virgin fibre. Paper industry always requires a proportion of virgin fibre to replace those which have deteriorated through recycling.

Archival property: “Many recycled papers are not recommended for archival purposes because the history of the recycled fibre that has gone into the manufacture of paper is unknown.”

GPO (UNITED STATES GOVERNMENT PRINTING OFFICE) released on April 22, 1999, PAPER SPECIFICATIONS STANDARD (New standards incorporate latest recycled paper requirements), No11. As far as recycled paper is concerned, the standard meet or exceed the president Clinton’s Executive order 13101 “Greening the Government Through Waste Prevention, Recycling, and Federal Acquisition” (September 14, 1998) minimum post-consumer fibre content requirements of 30%. (9)

5. A comprehensive view of the paper sector: National and international Pulp and Paper industry

A probe for information on the global scenario of the views and news at different levels indicate, North American countries (U.S, Canada) dominates the pulp and paper industry.
International paper being the worlds largest pulp and paper maker. Innovation is the aim of the pulp and paper industry. It is a much dynamic sector. “Book Industry treatise on responsible paper use” initiated by green press initiative; about 50% publishers in U.S have goals for increasing their recycled paper. V.P, Director, Production planning and paper, Michael DeFazio of the Random House expects to hit 30%mark in 2013(Proportion of recycled fibre it uses). On July 27, 2011, Scholastic announced that “It will increase its goal for 2012 from 30% to35% of all paper purchased”. On November, 2009, HachetteBook Group had announced to increase the publishers use of recycled paper by 2012 from 3% to 30% with majority of fibres to be post consumer.

According to CEPI(Confederation of European Paper Industries) “European declaration on paper recycling-70% recycling rate target in 2015 and design for environment;” “the paper industry is committed to improving its environmental performance;” In paper CEPI paper week 2011,(9) paper on “The revision of EN643” raises a question on availability of global lists of grades of recovered paper, quality control procedures and legislation.(5)50% of raw material of pulp and paper industry is recovered paper and board. Paper is the most recycled product in Europe with 64.5% recycling rate.

IPMA(Indian Paper Manufacturers Association) represents paper sector of India. In India 20% of waste paper is being currently recovered annually.(7). CPPRI(Central Pulp and Paper Research Institute had stated that by 2010 about half of the global amount of fibres used in papermaking will be recycled fibres. Industry's requirements are being met through import. Indian mills are in a shortage of waste paper for recycling.

6. Conclusion

A sample survey, at random on books specially published by the foreign publishers reveal the steady rise in the use of recycled or recyclable paper including implications of use of forest resources in the past years to signify the paper composition. (indicated sharply at the verso of the title page).

As wellbeing comes to be the question, we may extrapolate the word preservation giving priority towards preserving our environment, our future. Is the paper world surely going for it? or we, LIS professionals are compromising preservation issues someway? Recycled paper actually is the process of using fibre of the trees efficiently, not contribute to actually saving trees!(2) To label a paper as environmentally friendly is meaningless unless justified on the basis of fibre source, effluents, gaseous emissions etc. An inconsistency in standards regarding the components’ limits is evident. Specifications for paper are changing regularly. There is no universal specification. The Sustainable Office Forum (TSOF) Checklist states that recycled paper should include high proportion of post consumer waste. (3) For a publisher purchasing paper for his publication recycled fibre Content-the most vital point of concern , (6). These information if provided to the librarians may help in the long run as far as the deterioration of such a paper is concerned. A number of complex issues have been identified and indicated at the industry level, and with the associations dealing with the concerned topic, which may with time spread its limbs having a profound effect on the LIS professionals. It is the high time to recognise ourselves as a part of the paper process. Our paper resources are nonetheless important. This paper was specially concentrating on books as the paper-based backup we need to preserve globally in the changing scenario of library management.

Risk of Archives in Digital Age

Sanjukta Majumder
Rani Birla Girls' College, Kolkata 700017
Email: sanjukta069@gmail.com

Abstract: The paper is highlighting the factors of requirements for digitization of archives, the advantages and disadvantages of digitization of archival materials. The paper has tried to reveal the various challenges associated with digitization of archival materials. A special reference has been made on West Bengal State Archive to reveal the conditions of archive towards digitization.

Keywords: Archives, Digitization of archives, Challenges, West Bengal State Archive

Introduction

Archives are society's primary information provider and were early users of the new digital technology with respect to cataloging and processing management and for disseminating information. In the present technological world, the contemporary archivists are facing the most prevalent issues regarding digitization of archival materials. It is true that digitization will provide enormous benefits to both users and institutions, but it also presents a number of challenges before the archivists or record managers. And the most important challenge is the conversion of material to digital format taking into consideration the condition of records, contents of records and the users of records.

New technologies have emerged to allow the digitization of various items including paper, documents, photographs, sound recordings, and motion pictures. However, while digitization is possible, the question remains whether digitizing any part of a collection comports with the overall mission of the archivists: to gain the control of documents with enduring value, preserve them and make them available to others for research (Jenkinson, 1944/1984; Society of American Archivist, n.d.)

Need to Digitize

The reasons for implementing digital conversion of non-digital source material are varied: (Guidelines for digitization projects: for collection and holdings in the public domain, particularly those held by libraries and archives. March 2002. IFLA.)

- To increase and improve the access of specific collection.
- To improve the services to an expanding user's group by providing enhanced access to the institution's resources with respect to education, long life learning.
- To reduce the handling and use of fragile or heavily used original material and create a “backup” copy for endangered materials, such as brittle books or documents.
- To give the institution opportunities for the development of its technical infrastructure and staff skill capacity.
- To develop collaborative resources, sharing partnerships with other institutions to create virtual collections and increase worldwide access.
To seek partnerships with other institutions to capitalize on the economic advantage of a shared approach.

To take advantage of financial opportunities, for example, the likelihood of securing funding to implement a programme, or of a particular project being able to generate significant income.

**Benefits of Digitization**

(a) Improves Access: The main advantage over older formats is the increased access for researchers. Digital documents can be accessed and viewed by the maximum people at a wider range of times, and with less effort. By placing a copy of an item online, it becomes available to people all over the world. Multiple users can view the items simultaneously.

Access is also improved with digitization because research scholars can search and browse various options that enable them to find information with greater speed and accuracy. Similarly, in case of non-conventional materials, the conversion of audio/visual tapes gives researchers the opportunity to evaluate an increased amount of footage in a short period of time. Digitization also reduces the costs of maintaining the conventional paper documents for providing access.

(b) Improved Preservation: Digitization is important in respect of preservation. In many cases, the original item is in such a state of deterioration that if it is not practical to keep it for future use, or the format is so obsolete, making it very expensive to view.

An example of this is decaying eight millennium films belonging to an institution without the proper equipment to play it. In this instance, digitizing the film might be the best option to ensure that the content of the film can be assessed by forthcoming generation. Digital preservation is becoming an accepted practice for other type of items as well. Many industry experts believe preserving sound recordings in digital, not analogue format is the future of audio archives. (Council on Library and Information Resources and Library of Congress[CLIR], 2006. P.2)

Digitization helps in duplicating the items. Regarding manuscripts, and early printed books, digitization can be used to create substitute to make it access by researchers, while the original document will remain untouched.

(c) Decreased storage requirements: Digitization helps in reduction of necessary storage space, especially when dealing with a large number of items. Large number of conventional document can exist in few hard drives or optical disks, or in other electronic Medias.

**Disadvantage of Digitization**

Though there are lot of positive or correct views and results in digitization of archival materials, but there are few disadvantages are also there:

- Digital images are not human readable without computer equipment.
- Significant equipment costs, including hardware and software.
- Generally, electronic systems and software are changing within few years, and therefore life expectancy of media is relatively short.
- Different type of scanners may be required to scan text, oversize items, photographs print, slides and other formats.
- Digital quality control and image and metadata capture and management are complex, time consuming processes requiring expertise.
Complex disposition and potential problems in implementing disposition

West Bengal State Archive: A case study

West Bengal State Archives (1962) is the oldest archive in India. At the beginning, it served as National Archive of India and afterwards when the National Archive was shifted to Delhi by East India Company, the archives at Bengal started to work as State Archive of Bengal. Now it is working under Government of West Bengal. Any researcher or scholar is able to work in this archive with proper authenticate permission from director of Archive. The library in Archive can be used by the staff and researcher of the Archive.

West Bengal State Archives is situated at the heart of the city Kolkata at 6, Bhabani Dutta Lane, Kolkata 73. The dearth of space has forced the Archive to spread its collection in two other places. The places are West Bengal State Archive, Writer's Building, Kolkata; and West Bengal State Archive, 43 Shakespeare Sarani, Kolkata.

Collection: The main objective of East India Company for the development and establishment of this Archive are as follows:

- To centralise all the revenue and judicial records of Government of India and Bengal;
- To prepare and preserve the public records of Bengal.

The collection policy of the State Archive is to collect and archived those documents that are thirty years old. According to the aforesaid history and the growing collection after independence also, the present collection record of West Bengal State Archives shows the following:

<table>
<thead>
<tr>
<th>Address</th>
<th>Subject</th>
<th>Year</th>

<td>IB Reports</td>
<td>1905 - 1942</td>
</tr>
<tr>
<td>Writer's Building</td>
<td>All governmental records</td>
<td>1947 - current</td>
</tr>
</tbody>
</table>

Challenges: Digitization helps archivist by developing improvements in preservation, access and other archival activities. But the nature of archival materials of State Archives leads to various challenges in front of the archivists in digitizing the materials.

- Planning - Before digitization, the archivists need a full effort to plan on various factors. Like, selection of archival documents according to their condition; if the item to be accessed over the internet; selection of server and hard drive is to be made, if saving to an optical disk one must choose between CD ROM and DVD based discs, need to determine the file type to be created, e.g., PDF format or TIFF format, etc. The archivists must choose computer equipments and applications that are compatible with the selected file types. In few cases, the project needs a high level of planning, expertise, greater amount of staff, advanced level of technology, etc. With all these efforts the state archive is proceeded towards digitization at Shakespeare Sarani branch.

- Copyright - Copyright refers to an author's work in literature, music, art and is legally protected. The application of this protection is complex as restricted activities vary based on many factors, including when an item was created, its original purpose, and the intended use of potential copies. With few exceptions though, displaying or
distributing copy of a work to the public without the permission of the rights holder is a copyright violation. For this reason, before establishing digital archive, which could be accessed through the internet, the archivist of State Archive are need to make every effort to locate the creator of the material to be digitized.

- Digitization Process - To ensure the best quality of the digital copy, the archivist of State Archives need to prepare the originals. Cleaning the items is most necessary in case of archives. Dirty paper documents and photographs can result in blurry reproductions. The presence of dust, mould or fungus can negatively impact the playback of audio discs, audio tapes, and video tapes, and all types of films (CLIR, 2006, pp6-7). Great care need to be taken by the archives during the conservation of materials. Like, during scanning of items, machine can generate intense light and heat; playing a deteriorating videotape can damage it further; temperature of the electronic machines could be responsible in damaging the original works during digitization time. Therefore, the new building of Archive at Shakespeare Sarani, Kolkata, has been prepared with the above view points to digitise their materials.

- Post digitization Concern - According to the Digital Imaging Working Group , “Generally captured and conversion of data often comprises only the one third of the total cost, while cataloguing, description, and indexing comprises two third of the total costs.” The activities of post conversion are laborious and it is essential to maintain the integrity of the data to allow to the researchers in finding relevant information.

The main risk factors for Archives regarding digitization is Right To Information Act – It is an act which ensures the citizen of the country to retrieve information or access to information, under the control of public authorities, in order to promote transparency and accountability in the working of every public authority, the constitution of a Central Information Commission and State Information Commissions, and for matters connected therewith or incidental thereto. As a result, it is important for the archives and archivists to provide information to the citizens of the country on demand. But, as archives hold rare, valuable and secret information of the region, it is difficult to disseminate the information smoothly.

The West Bengal State Archives has various rare and secret documents of Ministry of Defence which are not allowed for public access as they can cause country's security problem. Along with the above documents it holds various governmental documents regarding decision making policies, cultural values etc which may require to be kept in hidden form. Therefore, the West Bengal State Archives though has started the digitization of its documents but it still in decision making process regarding the online version of Archival documents.

Conclusion

The archives and records form an essential and significant part of a nations’ information resources, and that programmes for their management and use are, or should be, an integral part of the national information system. Modern records and archival services have to deal with a vast amount of materials and have to find the ways of exploiting their information contents under the constraints of a budget which never generous, has probably been subjected in recent years to new restrictions.

Therefore, digitization is essential and must to accommodate the growing number of records which are need to preserve for the posterity. But as the archives are the integral part of the concern, whether organization or country, the records need to be checked and
authority need to decide properly before publicise them. As digitization is risky for the quality matter of old documents like handling of papers for digitizing the files, simultaneously, the quality of the documents, i.e. the contents also need to hidden due to certain sensitive issues which the archival files are holding. The West Bengal State Archives is still in the turmoil of digitization and online version of their documents, as they are holding the country’s oldest documents in their collection.

Analysis of LIS Forum 2008-2011: A Study

Sonali Dapsi
Central Library
The University of Burdwan

Abstract: The purpose of this paper is to analyze the recent trends of LIS forum for last four years. It also shows the distribution of subject and other LIS related topics in 2008-2011 and compare of social network in Library and information science (LIS LINK)

Keywords: Scientometrics, Bibliometrics, LIS Forum, LIS LINK

Introduction

Library and Information science is an interdisciplinary science contributed from the different basic subjects. Scholarly communication of research has changed from the oral to the written, next written to the printed and now from print to the electronic environment. LIS Forum sponsored by NISSAT/DSIR also called discussion forum. It is launched in November, 1994.

This Forum is automated and controlled using a computer program. New subscription request are received when a person send or post message to the list server. It maintains a database archive. The purpose of this study is to analyze of current trends of LIS Forum from the websites.

Lis Links

LIS Links is the India's first and largest Social Network for Library and Information Science Professionals. This is the virtual community for LIS professionals. Different type of format will be accepted. It gives us "Hot of the Month (top twenty) list of last six month. It accept to add new information, edit, delete, change information change to categories, discussion style, tag, feature and re-open discussion. It can include college, universities to provide LIS related information and also provide Library Association related information.

Categories of LIS LINK:
- Chart
- Invite
- New in LIS related
- Member
- Discussion
- Job vacancy
- Video
• Guide NET/SET
• Top of The Month
• Top of the member
• OJISE
• About LIS LINK

<table>

Methodology

A computerized data input sheet was prepared in MS-Excel to record all these data. After completion of input work, each data set was checked to determine data accuracy.

Component of Mailing Lists :-

• Mail Processor
• Command Processor
• Mail Server
• Active Server

Total 5833 topics are analyzed during last four years.

Feature of Forum:-

1. One can communicate different people.
2. Find new information or peer work.
3. Exchange the informal information.
4. Enable posting problem.
5. Increasingly important the update information

Findings and Discussion

An analysis of the LIS Forum for the period 2008-2011 examined and it will reflect in the below-mentioned figure:
Number of Distribution in Library and Information Science Topics year wise in LIS Forum 2008-2011

![Year wise Distribution Chart]

It was found that LIS related topics like development of LIS and job vacancy, article request service which are not found in a particular library are the main concern. Call for paper for any conference, seminar or workshop is the next. This forum always gives up-to-date information of all library peoples. It can be solving any software related technical problem. Besides, this forum also has information like awards, sad news, day celebration and new information in LIS related subject.

Abstract: From the ancient time to till date the medium and method of library resources preservation have undergone many changes. The preservation problems are as old as the libraries are. With the increasing production of information in digital form, its protection from vulnerability and threats are also becoming equally important. The digital preservation is of utmost importance in order to maintain the mission of preserving a record for future use. Digital preservation is the management of digital information over time. This paper is an attempt to describe the different aspects of digital preservation such as what do we exactly mean by Digital Preservation; why do we need for preservation of digital information; explores various strategies and methodologies for preserving digital information; an outline of the benefits and challenges of digital preservation. Major initiatives carried out by several organizations worldwide as well as in India regarding digital preservation have also been highlighted.

Keywords: Digital preservation, Technological obsolescence, Bit-steam copying, Refreshing, Migration, Emulation, National Digital Preservation Programme

1 Introduction

Computer revolution in the modern age has an impact on libraries. Computer networks help the user to make themselves free from the physical restrictions of the library. Over the years, libraries have been entrusted to perform major role in case of collection development as well as preservation of those documents. These functions are undergoing profound changes in this digital era. Digital preservation is not a new concern. It began when the first computers were introduced. A number of national archives, data archives, and other cultural institutions in many countries established digital preservation programs as early as the late 1960s.

Digital Preservation encompasses a broad range of activities designed to extend the usable life of machine-readable computer files and protect them from media failure, physical loss, and obsolescence. Rapid technological advances do not solve the problem. For digital records, the preservation issues extend beyond media life considerations. Devices for reading these media rapidly become obsolete; the various formats for digital documents and images introduce additional complications. The content and historical value of many governmental, organizational, legal, financial, and technical records, scientific databases, and personal documents may be irretrievably lost to future generations if we do not take steps to preserve them.\textsuperscript{1}

Digital preservation is the set of processes and activities that ensure continued access to information and all kinds of records, scientific and cultural heritage existing in digital formats. Digital preservation is defined as long-term, error-free storage of digital information, with means for retrieval and interpretation, for the entire time span the information is required.
Emerging Trends including Knowledge Management

for. Libraries and archives are constantly upgrading their equipment, and the staff learns the new software quickly, often dropping the old.

Libraries and archives cannot save the old machines when spare parts are no longer available, and when the staffs no longer know how to use the old software, it is unceremoniously discarded. Dependence on standards for storage of digital information ameliorates, but does not completely relieve this problem of hardware and software obsolescence. Therein lies the danger. Rapid changes in the means of recording information, in the formats for storage, and in the software for use threaten to shorten the life of information in the digital age to a few years. Preservation is a fundamental responsibility of libraries and archives of record. Margaret Hedstrom points out that “...digital preservation raises challenges of a fundamentally different nature which are added to the problems of preserving traditional format materials.”

2. Types of Digital Resources

Digital objects can be divided into two main groups: digitized material, converted from documents or other media into electronic format, and natively digital (i.e. born-digital) material, which was created in digital form.

3. What is Digital Preservation?

Digital preservation is a set of activities required to make sure digital objects can be located, rendered, used and understood in the future. This can include managing the object names and locations, updating the storage media, documenting the content and tracking hardware and software changes to make sure objects can still be opened and understood.

There is several ways to define the digital preservation such as-

3.1 “Digital preservation combines policies, strategies and actions to ensure access to reformatted and born digital content regardless of the challenges of media failure and technological change. The goal of digital preservation is the accurate rendering of authenticated content over time.”

3.2 The term “digital preservation” refers to both preservation of materials that are created originally in digital form (i.e. born-digital) and the use of imaging and recording technologies to create digital surrogates of analog materials for access and preservation purposes.

The Task force on Archiving of Digital information emphasizes that the central goal of digital preservation must be to preserve information integrity. It defines five components that constitute the integrity of digital documents, such as: Content (i.e. intellectual substance contained in information objects), Fixity (i.e. content fixed in a discrete object as opposed to continuously updated documents), Reference (i.e. reliable systems for locality and citing), Provenance (i.e. a record of the documents origin and chain of custody), and Context (i.e. a documents interaction with elements in the wider digital environment).

4. Why Digital Preservation?

Society's heritage has been presented on many different materials, including stone, vellum, bamboo, silk, and paper. Now a large quantity of information exists in digital forms, including emails, blogs, social networking websites, national elections websites, web photo albums, and sites which change their content over time. The unique characteristic of digital forms makes it easy to create content and keep it up-to-date, but at the same time brings many difficulties in the preservation of this content.
Basically, there are three reasons for which digital materials are become inaccessible: (i) degradation of the media on which they are stored, (ii) obsolescence of software making it impossible to read digital files, and (iii) introduction of new computer systems and peripherals that cannot handle older materials. All these reasons are discussed in the following way such as:

**4.1 Physical Deterioration**

The media on which digital contents are stored are more vulnerable to deterioration and catastrophic loss than some analog media such as paper. Digital objects are fragile because they require various layers of technological mediation before they can be heard, seen or understood by people. Digital objects are also much more vulnerable to physical damage. Even under the best storage conditions, however, digital media can be fragile and have limited shelf life. For example, one scratch on CD-ROM containing 100 e-books can make the content inaccessible, whereas to damage 100 hard copy books by one scratching move is - fortunately - impossible. Another example, while you can put a book on a shelf and return to it in upwards of 100 years and still open it and see the content as it was intended by the author/publisher, the same approach of benign neglect to a digital object is almost a guarantee that it will be inaccessible in the future. So early attention to the difficulties in preserving digital information focused on the longevity of the physical media on which the information is stored. Efforts to preserve physical media thus provide only a short-term, partial solution to the general problem of preserving digital information.

**4.2 Digital/Technological Obsolescence**

Digital technology is developing quickly and retrieval and playback technologies can become obsolete in a matter of years. When faster, more capable and less expensive storage and processing devices are developed, older versions may be quickly replaced. When software or decoding technology is abandoned, or a hardware device is no longer in production, records created with such technologies are at great risk of loss, simply because they are no longer accessible. This process is known as digital obsolescence. There are some other important issues such as- uncontrolled accumulation of data, unauthorized tampering with data, lack of metadata and system documentation, electronic data in forms that cannot be preserved, lack of empowering mechanisms for preservation, etc threaten our digital heritage.

**5. How Digital Preservation?**

A preservation strategy must include more than just what can be achieved by good system back-up procedures. A strategy is needed also to ensure the long-term accessibility of digital content objects deemed to have enduring value.

A preservation strategy details the types of activities that will be undertaken to ensure reliable preservation of digital content objects. These activities include:

i. Assessing the risks for loss of content posed by technology variables such as commonly used proprietary file formats and software applications.

ii. Evaluating the digital content objects to determine what type and degree of format conversion or other preservation actions should be applied.

iii. Determining the appropriate metadata needed for each object type and how it is associated with the objects.

iv. Providing access to the content.
There are a number of methods that can be followed for preserving electronic/digital publications:

5.1 Bit-stream Copying

Bit-stream copying, commonly known as “backing up data” refers to the process of making an exact duplicate of a digital object. It deals only with the question of data loss due to hardware and media failure, whether resulting from normal malfunction and decay, malicious destruction or natural disaster. It should be considered the minimum maintenance strategy for even the most lightly valued, ephemeral data.

5.2 Refreshing

In the face of rapid technological obsolescence and to overcome the problem of media fragility, archivists have adopted the technique of “refreshing” digital information by copying it onto new media. Refreshing digital information by copying will work as an effective preservation technique only as long as the information is encoded in a format that is independent of the particular hardware and software needed to use it and as long as there exists software to manipulate the format in current use. Medium refreshing is the copying data from a physical carrier (e.g. diskette) to another physical carrier of the same type (e.g., a new diskette).

Refreshing is the transfer of data between two types of the same storage medium, so there are no bit rate changes or alteration of data. For example, transferring census data from an old preservation CD to a new one. But refreshing does not solve the problem of backward compatibility if the software changes.

5.3 Migration

Migration is the transferring of data to newer system environments. This may include conversion of resources from one file to another (e.g., conversion of Microsoft Word to PDF or Open Document), from one operating system to another (e.g., Windows to Linux) or from one programming language to another (e.g., C to Java) so the resource remains fully accessible and functional. Migration is the periodic transfer of digital materials from one hardware/software configuration to another or from one generation of computer technology to a subsequent generation. The purpose of migration is to preserve the integrity of digital objects and to retain the ability for clients to retrieve, display, and otherwise use them in the face of constantly changing technology. Resources that are migrated run the risk of losing some type of functionality since newer formats may be incapable of capturing all the functionality of the original format, or the converter itself may be unable to interpret all the nuances of the original format.

5.4 Replication

Creating duplicate copies of data on one or more systems is called replication. Data that exists as a single copy in only one location is highly vulnerable to software or hardware failure, intentional or accidental alteration, and environmental catastrophes like fire, flooding, etc. Digital data is more likely to survive if it is replicated in several locations.

5.5 Emulation

Emulation is the replicating of functionality of an obsolete system. Emulators may be built for applications, operating systems, or hardware platforms. Emulation of technical environment is the use of systems which run in a new operating environment, but emulate (simulate) a previous, now obsolete environment. The feasibility of emulation as a catch-all
solution has been debated in the academic community. The digital tablet takes emulation one step further, offering an alternative strategy that would store not only the digital documents, the hardware and the software needed to run them, but also the power source needed to display the recorded information in future.

6. Positive Aspects Of Digital Preservation

The following are some of the positive aspects of digital preservation:

- **Legal**
  
  National legal frameworks often require organisations to provide adequate records of business processes, communications and many other types of data for many years after their creation.

- **Accountability & protection from litigation**
  
  Recent legal cases have shown the importance of being able to search and recover archived emails quickly and in a legally admissible manner.

- **Protecting the long term view**
  
  Access to digital data is critical to ensure business continuity and to support decision making with a long term view. For research in particular preserving data may be crucial for identifying long-term trends.

- **Protecting investment**
  
  The valuable intellectual assets of organisations are increasingly in digital form. This data represents both intellectual property and a considerable investment of time, effort and money. It would therefore be foolish not to protect and preserve these assets adequately.

- **Reuse**
  
  Repositories of digital information and the tools to mine, analyse and re-purpose them represent a society’s intellectual capital. Effective and affordable digital preservation solutions are essential to transfer digital data into valuable assets for business.

7. Challenges

The major challenges are as follows:

- Technological obsolescence represents a far greater threat to information in digital form than the inherent physical fragility of many digital media.

- The major obstacle is digitization. Digitization is very cost intensive. Especially when one goes single handed toward digitization.

- Administration of the digital collections locally, is harder and more expensive than managing a comparable print collection.

- An intellectual property right is a big barrier for preserving the digital documents. Copyright protects the owner’s creative or intellectual work. Digitization of documents are involved with complex method for resolving the legal and practical questions of migrating intellectual property, that includes the creators and owners of intellectual property, managers of digital archives, and actual and potential users of intellectual property.
Digital library are considered by many to be a challenging area. There is a high requirement for expertise. But the actual scenario is that we don't have real expert personnel in this area.

8. Preservation Stakeholders

It includes first the creator of the digital objects, who may be individuals, institutions or organizations. Other stakeholders may be publishers, distributors, system administrators, libraries and library consortia, archives, funding agencies and users.

Followings are some of the major players regarding digital preservation programme:

9.1 International Scenario

- National Digital Information Infrastructure and Preservation Program (NDIIPP), run by The Library of Congress, is dedicated to ensuring that the digital information that conveys our history and heritage is available and accessible for generations to come. As a pioneer in the field of digital information, the Library has continued to provide digitized access to its vast collections.
- Meta Archive Project Six universities (Emory University, the Georgia Institute of Technology, the Virginia Polytechnic Institute and State University, Florida State University, Auburn University and the University of Louisville) and the Library of Congress are developing "a cooperative for the preservation of at-risk digital content about the culture and history of the American South" in a private LOCKSS network.
- The British Library is responsible for several programmes in the area of digital preservation. The National Archives of the United Kingdom have also pioneered various initiatives in the field of digital preservation.
- The National Digital Heritage Archive (NDHA) programme is a partnership between the National Library of New Zealand, Ex Libris Group and Sun Microsystems to develop 'Preservation' a digital archive and preservation management system.
- PADI is a comprehensive archive of information on the topic of digital preservation from the National Library of Australia

Many research libraries and archives have begun or are about to begin Large-Scale digital preservation initiatives (LSDI's). The main players in LSDIs are cultural institutions, commercial companies such as Google and Microsoft, and non-profit groups including the Open Content Alliance (OCA), the Million Book Project (MBP), and HathiTrust.

9.2 The Indian Scenario

Government of India is implementing National eGovernance Plan (NeGP), HRD has national mission on ICT in education and several others. IT applications are like eMedia, eCommerce/eBusiness and research data etc. are growing day by day. Unless significant effort is put urgently into digital preservation and securing long-term access to these digital resources, uncertainties over archiving will impede the growth and take-up of digital services, e-sciences and new working practices. Secondly current investment in digitization and digital content will also only secure short-term rather than lasting benefits. Therefore, there is need for a national initiative on 'National Digital Preservation Programme (NDPP)'. Under these circumstances, a large number of organizations/institutions (both governmental and
nongovernmental) of India have already initiated digital preservation practices, as for example-

- Indira Gandhi National Centre for Arts, National Archives of India, Film Archives of India, All India Radio
- NIC, NISCAIR, DESIDOC, INSA, DRTC, ICRISAT, NIC, INFLIBNET
- The Indian Institute of Science, Bangalore, Indian Statistical Institute, Kolkata, Indian Institute of Astrophysics, Bangalore, IITs, IIMs
- Universities like Delhi University, Banaras Hindu University, Calcutta University, Burdwan University, Jadavpur University, Vidyasagar University, Hyderabad University, Mysore University
- M.S. Swaminathan Research Foundation Proposal: Centralized Data Management and Preservation Strategy, Chennai, Khuda Baksh Oriental Research Institute, Patna, National Aerospace Laboratories (NAL), National Chemical Laboratory, Pune, National Institute of Oceanography
- The Asiatic Society, Kolkata
- West Bengal State Central Library, Kolkata
- Central Secretariat Library, New Delhi

10. Conclusions

The development of digital technology opened up new avenues for storing and retrieving information in bits and bytes. No single digital preservation strategy can serve as a practical solution to the problem of technological obsolescence for digital materials.

The methods used will vary depending upon the complexity of the original data objects, the extent to which the functionality for computation, display, indexing, and authentication must be maintained, and the requirements of current or anticipated users.

The costs and the technical, legal and organizational complexities of moving digital information forward into the future raise our greatest fear about the life of information in the digital future. Uncertainty and lack of confidence about our will and ability to carry digital information forward into the future exert a major inhibiting force in our disposition to fully exploit the digital medium to generate, publish and disseminate information. In India, libraries are facing many problems initially in digital preservation as shortage of fund provided them, intellectual property right issues, less interest of parent institutes and staff. Under these circumstances, new preservation technology should be adopted, infrastructures are to be developed and personnel are to be trained for preservation. A network of preservation centers is to be developed. So the responsibility of preservation in this digital era cannot be ignored.
